

Elements — of — Ecology

FOURTH EDITION

ROBERT LEO SMITH

THOMAS M. SMITH

BRIEF CONTENTS

PART I WHAT IS ECOLOGY? 1

- CHAPTER 1 The Nature of Ecology 2
 CHAPTER 2 The Organism and Its Environment 9
 CHAPTER 3 Key Processes of Exchange 20

PART II CONDITIONS FOR LIFE 29

- CHAPTER 4 Climate 30
 CHAPTER 5 Light 43
 CHAPTER 6 Temperature 55
 CHAPTER 7 Moisture 71
 CHAPTER 8 Periodicity 85
 CHAPTER 9 Nutrients 96
 CHAPTER 10 Soil 109

PART III POPULATIONS 125

- CHAPTER 11 Properties of Populations 126
 CHAPTER 12 Life History Patterns 136
 CHAPTER 13 Population Growth 149
 CHAPTER 14 Intraspecific Population Regulation 165
 CHAPTER 15 Interspecific Competition 177
 CHAPTER 16 Predation 192
 CHAPTER 17 Parasitism and Mutualism 208
 CHAPTER 18 Human Interactions with Natural Populations 224
 CHAPTER 19 Population Genetics and Speciation 242

PART IV COMMUNITIES 267

- CHAPTER 20 Community Structure 268
 CHAPTER 21 Community Dynamics 279
 CHAPTER 22 Processes Shaping Communities 302

PART V ECOSYSTEMS 313

- CHAPTER 23 Production in Ecosystems 314
 CHAPTER 24 Trophic Structure 328
 CHAPTER 25 Biogeochemical Cycles 344
 CHAPTER 26 Global Environmental Change 363

PART VI A GUIDE TO ECOSYSTEMS 377

- Introduction: Ecosystem Patterns 378
 CHAPTER 27 Grasslands and Savannas 384
 CHAPTER 28 Shrublands and Deserts 396
 CHAPTER 29 Tundra and Taiga 407
 CHAPTER 30 Temperate Forests 418
 CHAPTER 31 Tropical Forests 430
 CHAPTER 32 Lakes and Ponds 439
 CHAPTER 33 Freshwater Wetlands 446
 CHAPTER 34 Streams and Rivers 460
 CHAPTER 35 Oceans 475
 CHAPTER 36 Intertidal Zones and Coral Reefs 486
 CHAPTER 37 Estuaries, Salt Marshes, and Mangrove Forests 496

CONTENTS

Preface

PART I WHAT IS ECOLOGY? 1

1 THE NATURE OF ECOLOGY 2

- 1.1 Ecology is a science 3
- 1.2 The major unit of ecology is the ecosystem 3
- 1.3 Ecosystem components form a hierarchy 3
- 1.4 Ecology has strong ties to other sciences 4
- FOCUS ON ECOLOGY 1.1:**
Ecology Has Complex Roots 5
- 1.5 Ecologists use scientific methods 4
- 1.6 Experiments can lead to predictions 7
- CHAPTER REVIEW 7

2 THE ORGANISM AND ITS ENVIRONMENT 9

- 2.1 Environmental conditions vary both in time and space 10
- 2.2 Organisms need a fairly constant internal environment 10
- 2.3 Homeostasis is possible only within a limited range of conditions 12
- FOCUS ON ECOLOGY 2.1:**
Conditions for Reproduction 13
- 2.4 An organism cannot do equally well in differing environments 13
- 2.5 The distribution of organisms reflects environmental variation 15
- 2.6 An organism lives in a habitat 16
- 2.7 Constraints and trade-offs in habitat use define an organism's niche 16
- CHAPTER REVIEW 19

3 KEY PROCESSES OF EXCHANGE 20

- 3.1 Life on Earth is based on carbon 21
- 3.2 Photosynthesis converts carbon dioxide and hydrogen into carbohydrates 21
- 3.3 Photosynthesis involves key exchanges 22
- 3.4 Plants of warm, dry environments use a different photosynthetic path 23
- 3.5 Desert plants modify photosynthesis to save water 24

- 3.6 Respiration generates energy from carbon compounds 25

FOCUS ON ECOLOGY 3.1:

- Studying Decomposition 25
- 3.7 Decomposition returns CO₂ to the atmosphere 25
- CHAPTER REVIEW 26

PART II CONDITIONS FOR LIFE 29

4 CLIMATE 30

- 4.1 Earth intercepts solar radiation 31
- 4.2 Intercepted solar radiation varies over Earth's surface 32
- 4.3 Air temperature decreases with altitude 32
- 4.4 Air masses circulate globally 35
- 4.5 Solar energy, wind, and Earth's rotation create ocean currents 36
- 4.6 Temperature influences the amount of moisture air can hold 36
- 4.7 Precipitation has a global pattern 37
- 4.8 Most organisms live in microclimates 37
- FOCUS ON ECOLOGY 4.1:**
Urban Microclimates 39
- CHAPTER REVIEW 42

5 LIGHT 43

- 5.1 Solar radiation includes visible light 43
- 5.2 Plant cover intercepts considerable light 43
- 5.3 The light a plant receives affects its photosynthetic activity 46
- 5.4 Species of plants are adapted to either high or low light 47
- 5.5 Aquatic plants live in a shaded environment 49
- QUANTIFYING ECOLOGY 5.1:**
Beer's Law and the Attenuation of Light 51
- FOCUS ON ECOLOGY 5.1:**
Leaf Morphology and Light 52
- 5.6 Plants have evolved defenses against ultraviolet radiation 53
- CHAPTER REVIEW 54

6 TEMPERATURE 55

- 6.1 All organisms live in a thermal environment 56
- 6.2 Plant-temperature interactions can be complex 56
- 6.3 Photosynthesis is temperature-sensitive 59
- 6.4 Plants have metabolic adaptations to heat and cold 59
- 6.5 Animals maintain temperature differently 60
- 6.6 Animals fall into three physiological groups 61
- 6.7 Poikilotherms depend on environmental temperatures 61
- FOCUS ON ECOLOGY 6.1:**
Body Size and Metabolism 62
- 6.8 Homeotherms escape the thermal constraints of the environment 64
- 6.9 Heterotherms may or may not regulate body temperature 64
- 6.10 Torpor helps some animals conserve energy 64
- 6.11 Animals exploit microclimates to regulate temperature 65
- 6.12 Insulation reduces heat exchange 66
- 6.13 Evaporative cooling in animals is important 67
- 6.14 Some animals use unique physiological means for thermal balance 67
- 6.15 Countercurrent circulation conserves or reduces body heat 67
- CHAPTER REVIEW 69

7 MOISTURE 71

- 7.1 The structure of water is based on hydrogen bonds 72
- 7.2 Water has important and unique properties 73
- 7.3 Osmosis and osmotic potential are essential to organisms 74
- 7.4 Water cycles between Earth and the atmosphere 74
- 7.5 Water moves through plants from soil to the atmosphere 76
- 7.6 Plants reduce water loss in drought 76
- 7.7 Plants of arid regions possess other means of survival 77
- FOCUS ON ECOLOGY 7.1:**
Water, Roots, and Leaves 78
- 7.8 Plants respond to flooding in various ways 79

- 7.9 Plants of saline habitats have physiologically dry environments 80
- 7.10 Animals have ways of maintaining water balance 81
- 7.11 Animals of arid environments conserve water 81
- 7.12 Animals of saline environments have special problems 81
- CHAPTER REVIEW 82

8 PERIODICITY 85

- 8.1 Living organisms possess innate rhythms of activity 86
- 8.2 Circadian rhythms operate the biological clocks 87
- 8.3 A model suggests how biological clocks measure time 87
- 8.4 The biological clock is a hierarchy of clocks 88
- 8.5 Circadian rhythms have adaptive value 88
- 8.6 Critical daylengths trigger seasonal responses 89
- 8.7 Activity rhythms of intertidal animals follow the tidal cycle 90
- 8.8 Phenology is the study of seasonal changes 91
- FOCUS ON ECOLOGY 8.1:**
Deer Antlers 92
- CHAPTER REVIEW 94

9 NUTRIENTS 96

- 9.1 Essential elements are either macronutrients or micronutrients 97
- 9.2 Geology and climate affect availability of nutrients 97
- 9.3 Plant uptake influences local availability of nutrients 97
- 9.4 Decomposers transform nutrients into usable form 99
- 9.5 Microorganisms help plants take up some nutrients 100
- 9.6 Plants are adapted to low-nutrient or high-nutrient environments 100
- FOCUS ON ECOLOGY 9.1:**
Carnivorous Plants 102
- 9.7 Soil acidity influences the availability and uptake of nutrients 104
- 9.8 The quality of plants affects the nutrition of consumers 105

- 9.9 Mineral availability affects animals' growth and reproduction 106
 CHAPTER REVIEW 107

10 SOIL 109

- 10.1 Soil is not easily defined 110
 10.2 Soil formation involves five interdependent factors 110
 10.3 Formation of soil begins with mechanical and chemical weathering 111
 10.4 Living organisms influence soil formation 111
 10.5 The soil body has horizontal layers or horizons 112
 10.6 Soils have distinguishing physical characteristics 113
 10.7 Cation exchange capacity is important to soil fertility 114
 10.8 Climate and vegetation produce different soil orders 115
 10.9 Soil supports diverse and abundant life 118
 10.10 Soils have been severely disturbed 120
FOCUS ON ECOLOGY 10.1:
 Fighting Soil Erosion 121
 CHAPTER REVIEW 122

PART III POPULATIONS 125

11 PROPERTIES OF POPULATIONS 126

- 11.1 Populations possess unique features 127
 11.2 Plant populations are complex 127
 11.3 Density affects individuals in a population 127
 11.4 Density is difficult to define 129
 11.5 Dispersion of individuals influences population density 129
 11.6 Determining density and distribution requires sampling 130
 11.7 Populations have an age structure 130
FOCUS ON ECOLOGY 11.1:
 Capture-Recapture Sampling 131
 11.8 Determining age structure requires finding individual ages 131
 11.9 Age pyramids portray age structure 132
 11.10 Sex ratios in populations may shift with age 133
 CHAPTER REVIEW 134

12 LIFE HISTORY PATTERNS 136

- 12.1 Reproduction may be sexual or asexual 137
 12.2 Sexual reproduction takes several forms 137
 12.3 Mating strategies take several forms 139
 12.4 Acquisition of a mate involves sexual selection 140
 12.5 Females attempt to acquire mates with the highest fitness 140
 12.6 In polygamy females have limited information for mate choice 141
 12.7 Organisms budget time and energy to reproduction 142
 12.8 Parental investment relates to the number of young 143
 12.9 Environmental conditions influence the number of young 143
FOCUS ON ECOLOGY 12.1:
 Life History Strategies 144
 12.10 Food supply affects the production of young 145
 12.11 The number of offspring may vary with latitude 145
 12.12 Fecundity relates to age and size 146
 CHAPTER REVIEW 147

13 POPULATION GROWTH 149

- 13.1 Mortality is the probability of surviving 150
 13.2 Life tables give a systematic picture of mortality and survival 150
 13.3 Plant life tables are more complex 151
QUANTIFYING ECOLOGY 13.1:
 Constructing a Life Table 151
 13.4 Life tables provide data for mortality and survivorship curves 153
 13.5 Natality is age-specific 155
 13.6 Natality and survivorship determine reproductive rates 155
 13.7 Net reproductive rate is an estimator of population growth 156
 13.8 Exponential growth is like compound interest 157
QUANTIFYING ECOLOGY 13.2:
 Exponential Growth and Compound Interest 157
 13.9 Rate of increase is used in population studies 158
 13.10 Population growth is limited by the environment 159

- 13.11 Populations fluctuate about some upper and lower limits 161
- 13.12 Low population can decline toward extinction 161
- 13.13 Past extinctions have been clustered in time 162
- 13.14 Extinction of species begins locally 162
- CHAPTER REVIEW 163

14 INTRASPECIFIC POPULATION REGULATION 165

- 14.1 Population regulation involves density dependence 166
- 14.2 When resources are limited, competition results 166
- 14.3 Intraspecific competition retards growth and reproduction 167
- 14.4 High density is stressful to populations 167
- 14.5 Dispersal may or may not be density-dependent 168
- 14.6 Social behavior may limit populations 169
- 14.7 Social dominance can affect reproduction and survival 171
- FOCUS ON ECOLOGY 14.1:**
The African Buffalo 170
- 14.8 Social interactions influence activities and home ranges 171
- 14.9 Territoriality may regulate populations 173
- 14.10 Plants capture and "defend" space 174
- 14.11 Density-independent influences can be strong 175
- CHAPTER REVIEW 175

5 INTERSPECIFIC COMPETITION 177

- 1 Species have positive, adverse, or zero effects on each other 178
- 2 Interspecific competition affects two or more species 178
- FOCUS ON ECOLOGY 15.1:**
A Chemical Solution to Competition in Plants 179
- There are four possible outcomes of interspecific competition 179
- Laboratory experiments support the Lotka-Volterra equations 182
- Studies suggest the competitive exclusion principle 182
- Competition experiments in the field are difficult 183

- 15.7 Exclusion may involve more than competition 184
- 15.8 A variable environment upsets equilibrium 185
- 15.9 Coexistence limits the population of each species 186
- 15.10 Species coexist by partitioning available resources 186
- 15.11 The niche relates to interspecific competition 187
- FOCUS ON ECOLOGY 15.2:**
Invasion of the Aliens 188
- 15.12 Organisms compress, expand, or shift their niches 190
- CHAPTER REVIEW 190

16 PREDATION 192

- 16.1 Mathematical models describe the basics of predation 193
- 16.2 Functional response models relate prey taken to prey density 194
- 16.3 Predators develop a search image for prey 196
- 16.4 Predators may turn to alternate, more abundant prey 196
- 16.5 Predators respond numerically to changing prey density 197
- 16.6 Prey have evolved defenses against predators 197
- 16.7 Predators have evolved efficient hunting tactics 198
- 16.8 Cannibalism is common to many animals 199
- 16.9 A species may prey on its competitor 200
- 16.10 Animals use a foraging strategy 200
- 16.11 Foragers seek productive food patches 201
- 16.12 Herbivory affects plant growth and reproduction 202
- 16.13 Plants defend themselves from herbivores 203
- FOCUS ON ECOLOGY 16.1:**
Grazing the West 204
- 16.14 Vegetation, herbivores, and carnivores interact 205
- CHAPTER REVIEW 206

17 PARASITISM AND MUTUALISM 208

- 17.1 Parasites feed on a host and cause disease 209

17.2	Hosts provide diverse habitats for parasites	209	18.8	Habitat restoration and protection is the key to saving wildlife	232
17.3	Many parasites spread by direct contact	210	18.9	We may control wildlife populations to maintain habitat	233
17.4	Some parasites spread by indirect transmission	211	18.10	Reintroductions can return species to depleted habitats	234
17.5	Transmission among hosts is essential to parasites	212	18.11	Protection and education must accompany restoration	234
17.6	Hosts respond to parasitic invasions	212	18.12	Many species clash with human interests	235
17.7	Parasites and hosts establish an uneasy truce	214	18.13	Widespread chemical control is harmful	235
17.8	Parasites may regulate host populations	214	18.14	Biological control has had some success	237
17.9	Social relations may be parasitic	215	18.15	Genetic approaches have advantages and drawbacks	238
	FOCUS ON ECOLOGY 17.1: Plagues upon Us	216	18.16	Mechanical and cultural control can be effective	238
17.10	Parasitism can evolve into a positive relationship	217	18.17	Integrated pest management combines approaches to control	239
17.11	Obligatory symbiotic mutualisms are permanent	217		CHAPTER REVIEW	240
17.12	Mutualisms may be obligatory but nonsymbiotic	218		19 POPULATION GENETICS AND SPECIATION	242
17.13	Facultative mutualisms such as seed dispersal are diffuse	219	19.1	Individual variation is a characteristic of populations	243
17.14	Mutualisms are often necessary for pollination	220	19.2	Genetic variation is the raw material for natural selection	243
17.15	Some mutualisms are defensive	221	19.3	Alteration of genetic material results in inheritable change	244
17.16	Population effects of mutualism may be complex	221	19.4	Variation is transmitted by sexual reproduction	245
	CHAPTER REVIEW	222		QUANTIFYING ECOLOGY 19.1: Predicting Gene Frequencies	246
18 HUMAN INTERACTIONS WITH NATURAL POPULATIONS	224		19.5	Environmental forces may favor one phenotype	247
18.1	Managing exploited populations began with fisheries	225	19.6	Inbreeding reduces genetic variability	249
18.2	Continued exploitation depends on sustained yield	225	19.7	Small populations may experience genetic drift	250
18.3	Overexploited populations show danger signs	228		FOCUS ON ECOLOGY 19.1: Genetic Drift in Small Populations	251
18.4	Economics interferes with sustained yield management	229	19.8	Species need a minimum number for survival	252
18.5	"Sustained yield" in forestry may not be sustained yield	229	19.9	Defining a species is critical and difficult	252
18.6	Exploitation has decimated wildlife	230	19.10	Species may be characterized by spatial relationships	253
	FOCUS ON ECOLOGY 18.1: Endangered Species—Endangered Legislation	231	19.11	Species vary over a geographic range	254
18.7	Wildlife restoration is a complex task	231		FOCUS ON ECOLOGY 19.2: Classifying Organisms	255

- 19.12 Certain traits keep species apart 256
- 19.13 Species arise through the evolutionary process 258
- 19.14 An outcome of speciation is adaptive radiation 260
- 19.15 Unrelated species may converge in form and function 261
- 19.16 Evolution of new species is a slow process 262
- CHAPTER REVIEW 263

PART IV COMMUNITIES 267

20 COMMUNITY STRUCTURE 268

- 20.1 Communities vary in biological structure 269
 - QUANTIFYING ECOLOGY 20.1:**
 - Some Measures of Dominance 269
- 20.2 Number and relative abundance define species diversity 270
 - QUANTIFYING ECOLOGY 20.2:**
 - Indexes of Diversity 271
- 20.3 Communities have defining physical structure 272
 - QUANTIFYING ECOLOGY 20.3:**
 - Community Similarity 272
- 20.4 Vertical layering is characteristic of all communities 273
- 20.5 Communities exhibit horizontal patterns 275
- 20.6 Communities have characteristic patterns of dispersion 277
- CHAPTER REVIEW 278

21 COMMUNITY DYNAMICS 279

- 21.1 Spatial variation in community structure is zonation 280
- 21.2 Defining boundaries between communities is often difficult 280
- 21.3 Transition zones are special environments 280
- 21.4 Fragmented habitats are like islands 283
- 21.5 Metapopulation theory applies mostly to habitat patches 286
- 21.6 Classification of communities is scale-dependent 287
- 21.7 Temporal variation in community structure is succession 288
- 21.8 Succession is common to all environments 290

- 21.9 Succession is either primary or secondary 292
- 21.10 Succession appears to move toward an end point 293
- 21.11 Disturbance initiates succession 293
 - FOCUS ON ECOLOGY 21.1:**
 - Fire—The Rejuvenator 295
- 21.12 Succession occurs in heterotrophic communities 295
- 21.13 Succession changes the distribution and abundance of animals 296
- 21.14 Community structure changes over geological time 298
- CHAPTER REVIEW 300

22 PROCESSES SHAPE COMMUNITIES 302

- 22.1 Two contrasting views of the community exist 303
- 22.2 The fundamental niche constrains community structure 303
- 22.3 Organisms alter the environment for other species 305
- 22.4 Changing environments affect an organism's ability to compete 306
- 22.5 Indirect interactions influence community structure 307
- 22.6 Changes in environmental conditions are autogenic or allogenic 307
- 22.7 Dominance changes along a temporal, autogenic gradient 308
- 22.8 Herbivory influences patterns of community dynamics 309
- 22.9 Both views of the community reflect different perspectives 310
 - FOCUS ON ECOLOGY 22.1:**
 - Other Views of Succession 310
- CHAPTER REVIEW 312

PART V ECOSYSTEMS 313

23 PRODUCTION IN ECOSYSTEMS 314

- 23.1 The ecosystem consists of the biotic and abiotic 315
- 23.2 All ecosystems have three basic components 315
- 23.3 The laws of thermodynamics govern energy flow 316
- 23.4 Primary production fixes energy 317
- 23.5 Energy allocation varies in plants 317

- 23.6 Climate influences productivity of terrestrial ecosystems 318
- 23.7 Nutrient availability limits productivity of oceans 321
- 23.8 Primary production varies with time 322
- FOCUS ON ECOLOGY 23.1:**
Productivity of a Cornfield 323
- 23.9 Primary productivity limits secondary production 324
- 23.10 Consumers vary in efficiency of production 325
- QUANTIFYING ECOLOGY 23.1:**
Production Efficiencies 325
- 23.11 Productivity of decomposers is influenced by climate 326
- CHAPTER REVIEW** 326

24 TROPHIC STRUCTURE 328

- 24.1 Food chains describe the flow of energy through an ecosystem 329
- 24.2 Species fit into trophic levels based on their food 329
- 24.3 Decomposers are a diverse group 331
- 24.4 Ecosystems have two major food chains 333
- 24.5 Energy flows through trophic levels 334
- 24.6 Energy decreases in each successive trophic level 335
- QUANTIFYING ECOLOGY 24.1:**
Ecological Efficiencies 337
- 24.7 Ecological pyramids portray trophic levels 337
- 24.8 Food chains link to form food webs 338
- FOCUS ON ECOLOGY 24.1:**
Altering Food Webs 339
- CHAPTER REVIEW** 340

25 BIOGEOCHEMICAL CYCLES 342

- 25.1 All nutrients follow biogeochemical cycles 343
- 25.2 Nutrients flow between reservoirs 343
- FOCUS ON ECOLOGY 25.1:**
The Gaia Hypothesis 344
- 25.3 The carbon cycle is closely tied to energy flow 345
- 25.4 The cycling of carbon varies daily and seasonally 346

- 25.5 The oxygen cycle is largely under biological control 346
- 25.6 Pollutants influence the dynamics of ozone 347
- 25.7 The nitrogen cycle begins with fixing atmospheric nitrogen 348
- 25.8 Human-made emissions of nitrogen act as pollutants 349
- 25.9 The phosphorus cycle has no atmospheric reservoir 352
- 25.10 The sulfur cycle is both sedimentary and gaseous 353
- 25.11 Human-made sulfur dioxide is a major air pollutant 354
- 25.12 The sulfur and nitrogen cycles produce acid deposition 355
- 25.13 Acid deposition impacts soils and aquatic systems 356
- FOCUS ON ECOLOGY 25.2:**
Air Pollution and Forest Decline 357
- 25.14 Heavy metals also cycle through ecosystems 358
- 25.15 Chlorinated hydrocarbons establish cycles 358
- CHAPTER REVIEW** 360

26 GLOBAL ENVIRONMENTAL CHANGE 363

- 26.1 Atmospheric concentration of carbon dioxide is rising 364
- 26.2 Higher atmospheric CO₂ concentrations increase uptake by oceans 365
- 26.3 Plants respond to increased atmospheric carbon dioxide 367
- FOCUS ON ECOLOGY 26.1:**
Monitoring Vegetation Change from Space 368
- FOCUS ON ECOLOGY 26.2:**
Raising CO₂ in a Forest: What Happens? 370
- 26.4 Greenhouse gases may change the global climate 370
- 26.5 Changing climates affect ecosystems 371
- 26.6 Global warming would raise sea level 374
- 26.7 Understanding global change requires the study of ecology on a global scale 375
- CHAPTER REVIEW** 375

PART VI A GUIDE TO ECOSYSTEMS 377

Introduction: Ecosystem Patterns 378

27 GRASSLANDS AND SAVANNAS 384

27.1 Domestic Grasslands 385

27.2 Tropical Savannas 391

STUDY QUESTIONS 394

28 SHRUBLANDS AND DESERTS 396

28.1 Climax Shrublands 397

28.2 Deserts 402

STUDY QUESTIONS 406

29 TUNDRA AND TAIGA 407

29.1 Tundra 408

29.2 Krummholz 413

29.3 Taiga 414

STUDY QUESTIONS 417

30 TEMPERATE FORESTS 418

30.1 Coniferous Forests 419

30.2 Broadleaf Forests 425

STUDY QUESTIONS 429

31 TROPICAL FORESTS 430

31.1 Types of Tropical Forests 431

31.2 Tropical Rain Forests 432

STUDY QUESTIONS 438

32 LAKES AND PONDS 439

32.1 Physical Characteristics 441

32.2 Structure 442

32.3 Function 445

32.4 Nutrient Status 447

32.5 Human Impact 449

STUDY QUESTIONS 450

33 FRESHWATER WETLANDS 451

33.1 Types of Wetlands 453

33.2 Structure 456

33.3 Function 457

33.4 Value of Wetlands 459

33.5 Human Impact 460

STUDY QUESTIONS 461

34 STREAMS AND RIVERS 462

34.1 Structure 463

34.2 Function 466

34.3 The River Continuum 470

34.4 Human Impact 470

STUDY QUESTIONS 474

35 OCEANS 475

35.1 Special Features 476

35.2 Structure 478

35.3 Function 482

35.4 Human Impact 484

STUDY QUESTIONS 485

36 INTERTIDAL ZONES AND CORAL REEFS 486

36.1 Rocky Shores 487

36.2 Sandy and Muddy Shores 490

36.3 Coral Reefs 492

36.4 Human Impact 494

STUDY QUESTIONS 495

37 ESTUARIES, SALT MARSHES, AND MANGROVE FORESTS 496

37.1 Estuaries 497

37.2 Salt Marshes 500

37.3 Mangrove Forests 504
