

THE COMPOUND EYE AND VISION OF INSECTS

EDITED BY G.A.HORRIDGE

Contents

PART I RECEPTOR ANATOMY

1. THE COMPOUND EYES OF APTERYGOTE INSECTS	3
by H. F. PAULUS	
1.1. Atypical compound eyes of Collembola	3
1.1.1. Lateral eyes of arthropleonean Collembola	4
1.1.2. The lateral eyes of Symphyleona	9
1.1.3. The orientation of the rhabdoms in the group of ommatidia	10
1.2. Presumed photoreceptors in Protura and Diplura	12
1.3. The compound eye of Thysanura	13
1.3.1. Zygentoma	13
1.3.2. The compound eye of Archaeognatha	15
1.4. The apterygote ommatidium and the phylogeny of the compound eye	17
2. ANATOMICAL CHANGES DURING LIGHT ADAPTATION IN INSECT COMPOUND EYES	20
by B. WALCOTT	
2.1. Eyes with palisade formation and radial pigment movement	21
2.2. Eyes with longitudinal pigment movements only	27
2.3. Eyes with movement of retinula cell bodies and iris pigments	29
2.4. Eyes with movement of cone, tract, and rhabdom	30
2.5. Discussion	32

PART II RECEPTOR PHYSIOLOGY

3. THE ORIGIN OF THE RECEPTOR POTENTIAL OF THE LATERAL EYE OF LIMULUS	37
by V. J. WULFF and W. J. MUELLER	
3.1. Methods	41
3.2. Results and discussion	43
3.2.1. The reversal of the receptor potential	43
3.2.2. The effect of Na ⁺ depletion	45
3.2.3. The configuration of the receptor potential	46
3.3. Conclusion	49

4. ELECTROPHYSIOLOGICAL PROPERTIES OF THE HONEY BEE RETINA	
by F. BAUMANN	
4.1. Resting potential	5
4.2. Receptor potential	5
4.3. Spike potential	5
4.4. Visual adaptation	5
4.5. The pigment cells	6
5. PATTERN RECOGNITION IN INSECTS	7
by R. WEHNER	7
5.1. Introduction	7
5.2. Pattern modulation	7
5.2.1. Image processing by the lens system	7
5.2.2. Resolving power and contrast transfer functions	7
5.3. Pattern detection	7
5.3.1. Preprocessing	8
5.3.2. Classification	8
5.4. Conclusions	10
6. INVESTIGATIONS ON THE VISION OF ANTS	11
by G. A. MAZOKHIN-PORSHNYAKOV	11
6.1. The structure of the compound eye	11
6.2. Electrical responses	11
6.3. Adaptation	11
6.4. Contrast sensitivity	11
6.5. Spectral sensitivity	11
6.6. Colour vision	11
6.7. Visual orientation and learning capacity	11
6.8. Conclusion	12
7. COLOUR RECEPTORS IN INSECTS	12
by R. MENZEL	12
7.1. Factors influencing spectral sensitivity	12
7.1.1. Photopigments	12
7.1.2. Spectral transmission of the dioptric apparatus	12
7.1.3. Selective reflection of the tapetum	12
7.1.4. Spectral transmission of the screening pigment	12
7.1.5. The rhabdom as a dielectric waveguide	12
7.1.6. Self-absorption of photopigments	13
7.1.7. Electrical coupling between retinula cells	13
7.1.8. State of adaptation	13
7.1.9. The experimenter and his methods	13
7.2. The spectral sensitivity of insect colour receptors	13
7.2.1. U.v.-receptors	13
7.2.2. Additional factors	13
7.2.3. Green-receptors	14
7.2.4. Other colour receptors	14

7.3. Distribution of colour receptors within and between ommatidia	145
7.4. Behavioural experiments in colour vision	149

8. FUNCTIONAL MORPHOLOGY OF THE COMPOUND EYE OF THE BEE 154

by F. C. GRIBAKIN

8.1. Introduction	154
8.2. Formation of the problem	155
8.3. Cytology of retinula cells in the dark-adapted state	155
8.3.1. The distribution of mitochondria in the retinula cells	156
8.3.2. Endoplasmic reticulum in the retinula cell	158
8.3.3. Screening pigment granules; interretinular fibres	160
8.3.4. Relations with secondary pigment cells	162
8.3.5. The rhabdomeres of the rhabdom	162
8.3.6. Summary	162
8.4. Types of visual cells	162
8.5. Light-induced structural changes in the rhabdomere	168
8.6. Further use of osmic acid to reveal receptor types	170
8.7. The basal cell and analysis of polarized light	171
8.8. Summary	175

PART III OPTICS

9. OPTICAL PROPERTIES OF INVERTEBRATE PHYSIOLOGY 179

by A. W. SNYDER

9.1. Introduction	179
9.2. Properties of dielectric waveguides	181
9.2.1. Light transmission (The concept of modes)	182
9.2.2. Excitation of modes (Modal power P_d)	184
9.2.3. Light absorbing optical fibres	187
9.2.4. Power absorbed by individual rhabdomeres of fused and laminated rhabdoms	190
9.2.5. Information contained within modes	192
9.2.6. Optical coupling between fibres	192
9.3. Application of dielectric waveguide theory to insect photoreceptors	193
9.3.1. Sensitivity of a photoreceptor-S	193
9.3.2. Information that a fused rhabdom can expect from modes	229
9.4. Summary and conclusions	233
9.4.1. Spectral sensitivity $S(\lambda)$	234
9.4.2. Polarization sensitivity	235
9.4.3. Angular sensitivity	236

10. EXAMINATION OF THE CLASSICAL OPTICS OF IDEAL APPOSITION AND SUPERPOSITION EYES 236

by P. CARRICABURU

10.1. Exner's theory	236
----------------------	-----

xiv *Contents*

10.1.1. Centred optical systems	236
10.1.2. The compound eye	240
10.1.3. Structure of the ommatidia according to Matthiessen	241
10.1.4. The glow	242
10.2. Consideration of Exner's theory	243
10.2.1. Homogeneity of the space between cones and rhabdoms	243
10.2.2. Ommatidia as afocal systems?	244
10.2.3. The transparent media of the ommatidium must have continuously variable indices	245
10.2.4. The erect pseudo-image	246
10.2.5. The glow	249
10.4. Crystalline tracts	250
10.3.1. Refractive indices	251
10.3.2. Propagation by threads and tracts	251
10.4. Conclusion	254
11. OPTICAL MECHANISMS OF CLEAR-ZONE EYES	255
by G. A. HORRIDGE	
11.1. Introduction	255
11.2. Anatomy of clear-zone eyes	255
11.2.1. Retinula cells fixed and proximal	256
11.2.2. Retinula cells mobile and distal	257
11.3. Terms relating to focusing of the eye	258
11.4. Available optical mechanisms for clear-zone eyes	260
11.4.1. Action of the cone extension or retinula cell column as a light guide	261
11.4.2. Unfocused light from the cone tip	263
11.4.3. An image formed by a pinhole at the cone tip	263
11.4.4. Image formation by the curvature of the corneal surfaces	264
11.4.5. Inhomogeneity of refractive index of the cornea	266
11.4.6. Growth layers in the corneal cone	269
11.4.7. Inhomogeneity of the refractive index of the crystalline cone	269
11.5. Mathematical models	271
11.5.1. The unfocused eye	271
11.5.2. The partially focused eye	273
11.5.3. The under- and over-focused eye	276
11.6. Physical consequences of the optical system	277
11.6.1. Divergence due to a single lens and the functions of the cone	277
11.6.2. An afocal system	278
11.6.3. Divergence of rays due to diffraction	280
11.6.4. The migration of pigment around the cone tip	281
11.6.5. Light summed upon the receptor layer and angular sensitivity	281
11.6.6. Conditions under which light guides are effective	281
11.6.7. The aperture of rhabdom columns	283
11.6.8. Increase in sensitivity caused by focusing	284
11.7. Methods available for analysis of clear-zone eyes	285
11.7.1. Search for superposition images behind eye slices	285

11.7.2. Observation of rays behind single cones	286
11.7.3. Observation of an erect image behind single cones	287
11.7.4. Observation of light guides in eye slices	287
11.7.5. Measurement of refractive indices in cornea and cone	288
11.7.6. Tracing rays to the receptor layer	288
11.7.7. Measurement of eyeshine	288
11.7.8. Receptor acceptance angle and acuity to stripes	289
11.7.9. The relative effectiveness of facets within the patch admitting light	290
11.7.10. Shining a narrow beam on the eye	290
11.7.11. Optomotor stimulation through a single facet	291
11.7.12. Response to a parallel beam versus diffuse light	291
11.7.13. An object poked into the eye	291
11.7.14. Observation of rays through the cornea and cone	292
11.7.15. Measurement of the distribution of light on the receptor layer	295
11.8. Conclusion	295
11.8.1. Summary of experimental findings	295
11.8.2. A figure of merit for clear-zone eyes	297
11.8.3. An evolutionary cul-de-sac	297
11.8.4. Lessons	298
12. THE DIOPTRIC SYSTEM IN BEETLE COMPOUND EYES	299
by V. B. MEYER-ROCHOW	
12.1. Introduction	299
12.2. The cornea	300
12.2.1. Morphology	300
12.2.2. Constitution of the cornea	300
12.2.3. Optical properties	304
12.3. The cone	306
12.3.1. Morphology	306
12.3.2. Structure and optical properties	306
12.4. Ray tracing	306
13. TWO CALCULATIONS ON OPTICALLY NON-HOMOGENEOUS LENSES	314
by S. MEGGITT	
13.1. Computer ray tracing	314
13.2. Calculation of radius of curvature of rays in a gradient of refractive index	317
14. THEORETICAL AND EXPERIMENTAL ANALYSIS OF VISUAL ACUITY IN INSECTS	321
by J. PALKA and R. B. PINTER	
14.1. Introduction	321
14.2. Theory and methods	322
14.2.1. Determination of OTF	326
14.2.2. Test patterns and their presentation	327
14.2.3. Experimental procedure	328
14.3. Results	333
14.4. Discussion	

PART IV

ELECTROPHYSIOLOGY OF THE OPTIC LOBE

15. THE FUNCTION OF THE LAMINA GANGLIONARIS	341
<i>by</i> S. B. LAUGHLIN	
15.1. Introduction	341
15.2. The anatomy of the lamina	342
15.2.1. Neurons in the lamina	343
15.3. The physiology of the lamina	345
15.3.1. Extracellular properties of the lamina	346
15.3.2. The input from retinula cell axons	347
15.3.3. Large monopolar cells	349
15.3.4. Integrative properties of large monopolar cells	351
15.3.5. Unit responses from the lamina	355
15.4. Conclusions	357
16. THE RELATIONSHIP BETWEEN VISUAL MOVEMENT DETECTION AND COLOUR VISION IN INSECTS	359
<i>by</i> W. KAISER	
16.1. Introduction	359
16.2. Experiments with striped rotating drums made out of pigment-papers	360
16.3. Spectral characteristics of the photoreceptors in the compound eye	361
16.4. Behavioural experiments with spectral lights	362
16.5. The contribution to the optomotor response made by the two receptor systems of the fly	364
16.6. Optomotor response studies using spectral lights: bees	368
17. INFORMATION PROCESSING IN THE INSECT COMPOUND EYE	378
<i>by</i> R. B. NORTHROP	
17.1. Introduction	378
17.2. Categories of units	379
17.2.1. Descending movement detector (DCMD) neurons and anomalous resolution	381
17.2.2. Vector units	389
17.2.3. Multimodel units in insect optic lobes	401
17.2.4. Non-form specific optic lobe units	402
17.3. Spatial frequency analysis in insect vision: future applications	403
17.3.1. Introduction	403
17.3.2. Spatial frequency domain description of objects	403
17.3.3. Neural spatial filter models	404
17.3.4. Spatial frequency analysis	406
17.3.5. Conclusion	407
17.4. Summary	408
18. MOTION DETECTORS IN LOCUSTS AND GRASSHOPPERS	410
<i>by</i> J. KIEN	
18.1. Direction-insensitive responses to movement	410
18.2. Direction-detecting neurons	412

18.3. Direction-detecting output from the brain	414
18.4. Direction-detecting behaviour: models for the optomotor response	416
18.5. Conclusion	421
19. UNITS OF THE OPTIC LOBE, ESPECIALLY MOVEMENT	423
by K. MIMURA	
19.1. Introduction	423
19.2. Types of units encountered	423
19.2.1. Responses of lamina units	423
19.2.2. Responses of medulla and lobula units	424
19.3. Movement-sensitive units	425
19.3.1. Classification of movement units	425
19.3.2. The mechanism of sensitivity to direction of motion	427
19.4. The motion-detecting system in insect behaviour	429
19.4.1. Movement of an object not distinguished from movement of the insect	429
19.4.2. Interaction between motion and air current stimuli	429
20. VISION DURING FLIGHT	437
by T. COLLETT and A. J. KING	
20.1. Introduction	437
20.2. Feature detection in hoverflies	438
20.3. Object recognition during flight and the problem of relative movement	447
20.4. Orientation in flight: the role of the optomotor system	449
20.4.1. Asymmetries in signal transmission	452
20.4.2. Saturation	452
20.4.3. Movement detectors confound stimulus parameters	452
20.4.4. Anomalous torque	453
20.5. Directionally-selective units as velocity detectors	455
20.6. Visual tracking	459
20.7. Centrifugal neurons to the optic lobe which monitor an insect's own movement	464

PART V BEHAVIOURAL ANALYSIS

21. HEAD MOVEMENTS	469
by M. F. LAND	
21.1. Introduction	470
21.2. Head movements	470
21.2.1. Methods	473
21.2.2. Orientation in the drum	473
21.2.3. Head movement during stripe fixation	477
21.2.4. Timing of head and body movements	477
21.2.5. Major changes of flight direction	480
21.2.6. Visual control of stabilization	480
21.2.7. Conclusions	

xviii *Contents*

21.3. Discussion	
21.3.1. Stabilization of head direction	482
21.3.2. Saccades and the optomotor loop	482
21.3.3. Saccades and fixation	485
21.3.4. Conclusions: head movements and vision	486
21.4. Summary	488
	489
22. LANDING AND OPTOMOTOR RESPONSES OF THE FLY MUSCA	490
<i>by A. FERNANDEZ PEREZ DE TALENS and C. TADDEI FERRETTI</i>	
22.1. Introduction	490
22.2. Methods	495
22.3. Monocular and binocular vision	495
22.4. Landing and optomotor responses	498
22.5. Conclusion	500
23. THE EFFECT OF ILLUMINATION ON THE LANDING RESPONSE	502
<i>by C. TADDEI FERRETTI and A. FERNANDEZ PEREZ DE TALENS</i>	
23.1. Introduction	502
23.2. Methods	502
23.3. Relations between pattern expansion and light level	502
23.4. Effect of the percentage of black in the pattern	507
 PART VI OCELLUS 	
24. THE NEURAL ORGANIZATION OF THE INSECT DORSAL OCELLUS	515
<i>by L. J. GOODMAN</i>	
24.1. Introduction	515
24.2. The neural organization of the ocellus	517
24.2.1. The retinula cells and their terminals	517
24.2.2. The neurons of the ocellar nerves	520
24.2.3. First-order synaptic organization in the locust	520
24.2.4. Second-order synapses within the ocellar nerve	527
24.2.5. Ocellar pathways within the brain	528
24.3. The physiology of the ocellus	535
24.3.1. The retinula cells and events at the first-order synapse	535
24.3.2. Ocellar units in the brain and ventral nerve cord	544
