

Eugene P. Odum

Basic Ecology

Holt-Saunders International Editions

Contents

✓1	Introduction: The Scope of Ecology	1
	1. Ecology—Its Relation to Other Sciences and Its Relevance to Civilization	1
	2. Levels of Organization Hierarchy	3
	3. The Emergent Property Principle	5
	4. About Models	8
2	The Ecosystem	13
	① Concept of the Ecosystem	13
	② The Structure of the Ecosystem	16
	3. The Study of Ecosystems	22
	4. The Biological Control of the Geochemical Environment: The Gaia Hypothesis	24
	5. Global Production and Decomposition	29
	6. The Cybernetic Nature and the Stability of Ecosystems	46
	⑦ Examples of Ecosystems	53
	8. The Classification of Ecosystems	82
3	Energy in Ecological Systems	86
	1. Review of Fundamental Concepts Related to Energy: The Entropy Law	86
	2. Energy Environment	93
	3. Concept of Productivity	98
	4. Food Chains, Food Webs, and Trophic Levels	121
	5. Energy Quality	146
	6. Metabolism and Size of Individuals	148

7. Trophic Structure and Ecological Pyramids 151
8. Complexity Theory, The Energetics of Scale, Law of Diminishing Returns, and Concept of Carrying Capacity 156
9. An Energy-Based Classification of Ecosystems 164
10. Energy, Money, and Civilization 169

4

Biogeochemical Cycles 175

1. Patterns and Basic Types of Biogeochemical Cycles 175
2. Quantitative Study of Biogeochemical Cycles 189
3. Watershed Biogeochemistry 194
4. The Global Cycling of Carbon and Water 199
5. The Sedimentary Cycle 206
6. Cycling of Nonessential Elements 209
7. Nutrient Cycling in the Tropics 211
8. Recycle Pathways: The Recycle Index 215

5

Limiting Factors and the Physical Environment 221

1. Concept of Limiting Factors: Liebig's "Law" of the Minimum 221
2. Factor Compensation and Ecotypes 233
3. Conditions of Existence as Regulatory Factors 236
4. Brief Review of Physical Factors of Importance as Limiting Factors 239
5. Anthropogenic Stress and Toxic Waste as a Limiting Factor for Industrial Societies 284

6

Population Dynamics 294

1. Properties of the Population Group 295
2. Basic Concepts of Rates 311
3. The Intrinsic Rate of Natural Increase 315
4. Population Growth Form 319
5. Population Fluctuations and "Cyclic" Oscillations 328
6. Density-independent and Density-dependent Action in Population Control 338

7. Population Structure: Internal Distribution Patterns (Dispersion) 344
8. Population Structure: Aggregation, Allee's Principle, and Refuging 348
9. Population Structure: Isolation and Territoriality 352
10. Energy Partitioning and Optimization: r - and K -Selection 356
11. Integration: Life History Traits and Tactics 365

7 Populations in Communities 368

1. Types of Interaction Between Two Species 368
2. Interspecific Competition and Coexistence 372
3. Predation, Herbivory, Parasitism, and Allelopathy (Antibiosis) 382
4. Positive Interactions: Commensalism, Cooperation, and Mutualism 393
5. Concepts of Habitat, Ecological Niche, and Guild 401
6. Species Diversity, Pattern Diversity, and Genetic Diversity in Communities 408
7. Populations and Communities in Geographical Gradients; Ecotones and Concept of Edge Effect 429
8. Paleoecology: Community Structure in Past Ages 437
9. From Populations to Communities to Ecosystems 441

8 Development and Evolution in the Ecosystem 444

1. The Strategy of Ecosystem Development 444
2. Concept of the Climax 469
3. Evolution of the Biosphere 473
4. Natural Selection: Allopatric and Sympatric Speciation; Microevolution versus Macroevolution 478
5. Coevolution 483
6. Evolution of Cooperation and Complexity: Group Selection 485

Contents

7. Relevance of Ecosystem Development and Biosphere
Evolution Theory to Human Ecology 487

Epilogue
The Predicament of Humankind: Futuristics 507

Appendix
Brief Description of Major Natural Ecosystem Types of
the Biosphere 520

Bibliography 565

Index 605
