

The Nature of Physical Geography

K. J. Gregory

Contents

Acknowledgements	vii
Preface	ix
Introduction	
1 Prologue and presumption	1
Constraints to consider – Method of approach	
Part I Antecedents 1850–1950	
2 A century for a foundation	16
Extrinsic influences – Intrinsic influences – Physical geography by 1945 – Systematic growth 1945–50	
Part II Themes for two decades 1950–1970	
3 Measurement mounting	41
Declining Davisian didactics – The atmosphere of science – Expressions of the quantitative revolution – Themes in the branches of physical geography – Quantitative assessment	
4 Chronology continuing	65
Basic foundations – Alternative models in historical geomorphology – Sea level changes – Quaternary geography and the prospect for environmental change	
5 Processes prevailing	87
Perceiving the need for process – Processes in the branches of physical geography – Methods of process investigations – Patterns of processes – Time and catastrophic punctuations – A process paradigm?	
6 The advent of man	116
Antecedents for the investigation of man in physical geography – The magnitude of man – Earth hazards – Urban environments – Environmental physical geography	

7 The environmental system: all systems go	140
Developing a systems approach – Systems in science – systems in physical geography – A focus within the environmental system	
 Part III Trends in ten years 1970–1980	
8 Time for change	161
Views of time – Time and the branches of physical geography – More general progress – Interdisciplinary awareness	
9 Advancing applications	186
Development of applied physical geography – Landscape ecology and mapping – Environmental evaluation – Impact, prediction and design – The future	
 Conclusion	
10 Evolving eighties	210
Remote sensing – Information technology – Trends so far	
 Bibliography	218
Index to authors	253
General Index	259
