## UNIT ONE

### FUNDAMENTAL MICROBIOLOGY

|                  |                                                                   |           |                  |                                                                               |            |
|------------------|-------------------------------------------------------------------|-----------|------------------|-------------------------------------------------------------------------------|------------|
| <b>CHAPTER 1</b> | <b>The invisible world</b>                                        | <b>2</b>  | <b>CHAPTER 4</b> | <b>Genes and biotechnology</b>                                                | <b>66</b>  |
|                  | <i>Penny Bishop</i>                                               |           |                  | <i>Penny Bishop</i>                                                           |            |
|                  | The importance of microorganisms in the environment               | 3         |                  | Genes                                                                         | 67         |
|                  | Microorganisms as pathogens                                       | 3         |                  | Structure of DNA                                                              | 67         |
|                  | The nature of living organisms                                    | 4         |                  | Nucleic acid synthesis                                                        | 68         |
|                  | Classification of living organisms                                | 4         |                  | Replication of chromosomal DNA                                                | 69         |
|                  | Prokaryotic and eukaryotic cells                                  | 5         |                  | Protein synthesis                                                             | 69         |
|                  | Viruses                                                           | 6         |                  | Mutation                                                                      | 72         |
|                  | Discovery of the causes of infectious diseases                    | 6         |                  | Transfer of genetic information                                               | 74         |
|                  | Infectious diseases in the 21st century                           | 14        |                  | Genetic engineering                                                           | 77         |
|                  | The global health scene                                           | 14        |                  | Methods of DNA analysis                                                       | 81         |
|                  | Reasons for the emergence and re-emergence of infectious diseases | 19        |                  | Clinical applications                                                         | 83         |
|                  | The Australian health scene                                       | 22        |                  | The ethics of genetic engineering                                             | 83         |
|                  | Conclusion                                                        | 23        | <b>CHAPTER 5</b> | <b>Viruses and viral diseases</b>                                             | <b>85</b>  |
| <b>CHAPTER 2</b> | <b>Biological reactions in microbial cells</b>                    | <b>25</b> |                  | <i>Penny Bishop</i>                                                           |            |
|                  | <i>Penny Bishop</i>                                               |           |                  | Characteristics of viruses                                                    | 86         |
|                  | Structure of biological molecules                                 | 26        |                  | Structure of viruses                                                          | 86         |
|                  | Specificity                                                       | 30        |                  | Classification of viruses                                                     | 88         |
|                  | Enzymes and chemical reactions                                    | 30        |                  | Host range and specificity                                                    | 88         |
|                  | Energy production in biological systems                           | 32        |                  | Viral replication                                                             | 89         |
|                  | Biochemical pathways of energy production                         | 33        |                  | Pathogenesis of viral infections in humans                                    | 92         |
|                  | Anabolism—biosynthesis of cellular components                     | 36        |                  | Host response to viral infection                                              | 93         |
|                  | Interrelationship of metabolic pathways                           | 36        |                  | Viral evasion mechanisms                                                      | 95         |
|                  | Practical applications of microbial processes                     | 36        |                  | Outcomes of viral infection                                                   | 95         |
|                  | Industrial applications of microbial metabolism                   | 38        |                  | Persistence of viral infections                                               | 97         |
|                  | Microorganisms as tools in scientific research                    | 40        |                  | Transmission of viral diseases                                                | 99         |
|                  | Environmental uses for microorganisms                             | 41        |                  | Diagnosis of viral infections                                                 | 104        |
| <b>CHAPTER 3</b> | <b>Bacteria</b>                                                   | <b>43</b> |                  | Growth of viruses in the laboratory                                           | 105        |
|                  | <i>Penny Bishop</i>                                               |           |                  | Prevention of viral disease                                                   | 106        |
|                  | Classification of bacteria                                        | 44        |                  | Treatment of viral infections                                                 | 108        |
|                  | Structure of bacteria                                             | 45        |                  | Future directions in virus research                                           | 108        |
|                  | Bacterial growth requirements                                     | 52        | <b>CHAPTER 6</b> | <b>Eucaryotic microorganisms: fungi, protozoa and multicellular parasites</b> | <b>111</b> |
|                  | Pattern of bacterial reproduction                                 | 55        |                  | <i>Penny Bishop</i>                                                           |            |
|                  | Identification of bacteria in clinical samples                    | 57        |                  | Fungi                                                                         | 112        |
|                  | Growth of clinical specimens                                      | 59        |                  | Parasites                                                                     | 123        |
|                  | Diversity of bacteria                                             | 60        |                  | Protozoa                                                                      | 123        |
|                  | Bacteria of medical importance                                    | 60        |                  | Helminths                                                                     | 129        |
|                  |                                                                   |           |                  | Ectoparasites                                                                 | 133        |
|                  |                                                                   |           |                  | Arthropod vectors                                                             | 135        |

## UNIT TWO

## HOST-MICROBE INTERACTIONS

137

## CHAPTER 7 Host-microbe interactions and principles of disease

138

*Penny Bishop*

Symbiosis

139

Microorganisms of the human body: normal microbiota (flora)

140

Infection and disease

144

The disease process

144

Koch's postulates

147

Signs and symptoms of disease

149

Development of disease

153

Types of infection

155

Spread of infectious diseases

159

## CHAPTER 8 Epidemiology: how diseases are spread

161

*Penny Bishop*

Communicable and non-communicable diseases

162

Reservoirs of infection

163

Portals of entry

166

Portals of exit

171

Transmission of microorganisms

173

Epidemiology

179

Evidence-based practice

183

## CHAPTER 9 The body's defence systems

186

*Gary Lee*

Overview of body defences

187

Innate immunity

188

Adaptive immune system

200

Disorders of the immune system

219

## CHAPTER 10 Pathogenic mechanisms and evasion strategies of microorganisms

228

*Gary Lee*

Adherence

229

Toxins

232

Invasion of cells

237

Cellular transformation into tumour cells

238

Other mechanisms of pathogenesis

238

Evasion strategies

239

## UNIT THREE

## PREVENTION AND CONTROL OF INFECTIOUS DISEASES

245

## CHAPTER 11 Principles of sterilisation and disinfection

246

*Gary Lee*

General principles of microbial removal

247

Selection of method for removal of microorganisms

249

Cleaning

250

Sterilisation

252

Disinfection

256

## CHAPTER 12 Antimicrobial therapy

264

*Penny Bishop*

The origins of chemotherapy

265

The development of antimicrobial drugs

266

Antibacterial drugs

267

Antifungal drugs

274

Antiparasitic drugs

275

Antiviral drugs

276

Therapeutic use of antimicrobial drugs

279

Implications for nursing practice

284

Development of resistance to antimicrobial drugs

286

Global spread of resistance

288

Probiotics

291

Alternative medicines

292

## CHAPTER 13 Infection control in healthcare facilities

295

*Gary Lee*

A brief history of hospital infection

297

The importance of healthcare-associated infections

298

Types of healthcare-associated infections

299

Organisms that cause healthcare-associated infections

299

Sources of hospital infections

304

Routes of transmission of microorganisms in healthcare

306

Factors contributing to the incidence of hospital-acquired infections

30

Control of infection in healthcare facilities

310

Other infection control considerations

318

Infection control teams

319

Specific problems in infection control

320

Occupational exposure for hospital staff

324

## CHAPTER 14 Issues in public health

327

*Penny Bishop*

The Australian health scene

328

Notifiable diseases

329

Infectious diseases in Australia

331

Analysis of notification rates

333

Primary healthcare

337

Screening procedures

337

Immunisation

339

Compliance with immunisation

344

Infectious diseases in childcare centres

352

Healthcare in rural and remote areas

355

|                                                                   |            |                                                                      |            |
|-------------------------------------------------------------------|------------|----------------------------------------------------------------------|------------|
| Infectious diseases from outside Australia                        | 364        | Acute infections of the lower respiratory tract                      | 429        |
| Public health issues in New Zealand                               | 367        | Chronic infections of the lower respiratory tract                    | 443        |
