

Ordinary Level Physics

A.F.ABBOTT

Fourth Edition

Contents

Mechanics and General Physics

1. Measurements

3

What is physics?—nature of physical knowledge—measurements in physics—work of national physical laboratories—measurement of length—use of callipers—how to read a vernier—micrometer screw gauge—precautions when using a micrometer screw gauge—mass and weight—measurement of mass—volume of liquids—measurement of time—unit and quantity symbols—model scale and vernier.

2. Force of gravity, weight and friction

13

Force—gravitational force—centripetal force—weights of standard masses—why weight varies—relation between total gravitational force and weight—action and reaction forces—weightlessness—artificial weight in a space station—friction—static friction—sliding friction—coefficient of friction—nature of friction—brakes—lubrication—air lubrication—further developments.

3. Speed, velocity and acceleration

22

Average speed—actual speed—scalar and vector quantities—distance and displacement—velocity—acceleration—equations of uniformly accelerated motion—velocity—time graphs—uniformly accelerated motion represented graphically—velocity from distance—time graph—acceleration from velocity—time graph—Galileo Galilei—simple pendulum and measurement of g —distance moved by a freely falling body related to time of fall—to measure g by the use of a centisecond timer.

4. Newton's laws of motion

35

Newton's first law of motion—momentum—Newton's second law of motion—to verify experimentally that $F \propto ma$ —weight of a body expressed in newtons—to calibrate a spring balance in newtons—use of calibrated spring balance—spring balance to measure mass as well as weight—weight of a body in a lift—Newton's third law of motion—conservation of momentum—rocket propulsion—jet engines.

5. Vectors

53

Addition of displacements—polygon of vectors—resultant force—to find the resultant of two forces—equilibrant—resolution of forces—addition of velocities—parallelogram rule for adding vectors—the ferryman's problem—three forces in equilibrium

6. Turning forces

Experiments to study moments—principle of moments—resultant moment—parallel forces—couples—parallel forces in equilibrium—centre of gravity—plumbline—centre of gravity by balancing method—centre of gravity by plumbline method—centre of gravity of a stool or tripod—to find the mass of an object by means of a metre rule—principle of beam balance—measuring mass of a metre rule by using a single known mass—steel yard—stable, unstable and neutral equilibrium.

62

7. Work, energy and power

Work—energy—mechanical energy—interchange of energy between p.e. and k.e.—internal energy—transfer of energy from one kind to another—heat energy—sun as a source of energy—nuclear energy—conservation of energy and mass—thermonuclear energy—power and its units—to measure personal power—kinetic energy calculation.

75

8. Machines

Lever—mechanical advantage—mechanical advantage of a lever—pulleys—tension in a string—block and tackle—velocity ratio—work done by a machine—efficiency—relation between mechanical advantage, velocity ratio and efficiency—variation of the mechanical advantage of a pulley system with load—inclined plane—screw—wheel and axle—gears—hydraulic press.

87

9. Density and relative density

Importance of density—simple density measurements—relative density—relative density of a liquid—calculation of density from relative density—advantage of the density bottle.

100

10. Pressure in liquids and gases

Pressure—atmospheric pressure—crushing can experiment—Magdeburg hemispheres—vacuum pump—pressure in a liquid—calculation of pressure—variation of pressure with depth in a liquid—a liquid finds its own level—measurement of gas pressure by manometer—care in the use of mercury—Torricelli's experiment—simple barometer—Pascal's experiments—Fortin barometer—aneroid barometer and altimeter—water barometer—pressure in relation to diving and aviation—calculation of atmospheric pressure in various units—density of dry air.

105

11. Application of atmospheric and liquid pressure

Rubber sucker—common pump—force pump—early fire pumps—preserving jar—transmission of pressure in fluids—hydraulic brake—comparison of liquid densities by Hare's apparatus—siphon.

119

12. The principle of Archimedes

Apparent loss in weight—Archimedes' principle—relative density of a solid and of a liquid by using Archimedes' principle—balloons—ships—Cartesian diver, submarines—floating bodies—law of flotation—hydrometers—relative density.

127

13. Some molecular properties of matter 137

Atoms and molecules—Brownian movement, kinetic theory of matter—nature of the force between atoms and molecules—three states or phases of matter—to measure the approximate length of a molecule—diffusion—surface tension—molecular explanation of surface tension—adhesion and cohesion—capillary attraction—osmosis—strength of materials—elasticity—Hooke's law—industrial applications of metallurgical studies—fluid friction—demonstration of terminal velocity.

Internal Energy and Heat

14. Measurement of temperature 153

Thermometers—to construct a mercury thermometer—fixed temperature points—Celsius temperature scale—determination of upper and lower fixed points—to measure temperature with a thermometer—clinical thermometer—Six's maximum and minimum thermometer—choice of liquid for thermometer—thermodynamic temperature scale.

15. Expansion of solids and liquids 159

Applications of thermal expansion—expansion of various substances—bimetallic strip—use of kelvins in SI units and definitions—linear expansivity of metal—thermal expansion in the kitchen—removing a tight glass stopper—gas thermostat—equation for expansion—expansion in area and volume—to compare the expansions of various liquids—real and apparent expansion of a liquid—unusual expansion of water—frost heave—density changes in water—biological importance of the anomalous expansion of water.

16. The gas laws 170

Galileo's air thermometer—Boyle's law—cubic expansivity of a gas at constant pressure—pressure expansivity of a gas at constant volume—absolute or thermodynamic scale of temperature—ways of expressing Charles's law and the Pressure law—reduction of gas volumes to s.t.p.—gas laws and the simple kinetic theory of matter.

17. Transmission of heat 184

Good and bad conductors—lagging—ignition point of a gas—Davy safety lamp—comparison of thermal conductivities—conduction of heat through liquids—convection in liquids and in gases—domestic hot water system—land and sea breezes—detection of radiation—thermopile—to compare the radiation from different surfaces—absorption of radiation—practical applications of radiation—vacuum flask—greenhouse.

18. Development of the concept of energy 196

Heat and internal energy—early ideas on the nature of internal energy—observations of Count Rumford—progress during the nineteenth century—Joule's experiments—potential energy transferred to internal energy in a waterfall—measurement of heat and internal energy—specific heat capacity—heat calculations—specific heat capacity by shot-tube method—temperature rise resulting from compression—importance of Joule's work—first law of thermodynamics.

19. Latent heat

Latent heat of vaporization and fusion—latent heat calculations—to measure melting point from a cooling curve—cooling produced by evaporation—to make ice by evaporation of ether—cooling by evaporation explained by the kinetic theory—fusion and vaporization in relation to the kinetic theory of matter—refrigerator—change of volume on solidification—effect of pressure on melting point, regelation—why ice is slippery.

204

20. Vapours

How liquids evaporate—vapour pressure—to measure the s.v.p. of a liquid—s.v.p. does not depend on volume—variation of s.v.p. with temperature—what happens when a liquid boils—variation of the boiling point of water with pressure—boiling under reduced pressure—fresh water supply on ships, desalination—determination of boiling point—pressure cooker—dew point—relative humidity—wet and dry bulb hygrometer—humidity control—air conditioning.

213

Optics

21. Light rays and reflection of light

Rays and beams of light—pinhole camera—shadows—eclipses—nature of light—reflection of light—laws of reflection—parallax—to locate images by no-parallax—to study the image formed in a plane mirror—parallax in pointer instruments—looking into a plane mirror—how the eye sees an image in a plane mirror—images formed in two mirrors inclined at 90° —kaleidoscope—parallel mirrors—periscope—Pepper's ghost—diffuse reflection—rotation of reflected ray.

223

22. Spherical mirrors

Principal focus—mirrors of large aperture—focal length of a spherical mirror is half its radius of curvature—construction of ray diagrams—images formed by a concave mirror—parallel beam from curved mirrors—reflecting telescopes—images formed by a convex mirror—accurate construction of ray diagrams—to measure the focal length of a concave mirror—magnification formula—mirror formula—sign conventions.

235

23. Refraction at plane surfaces

Laws of refraction—to verify Snell's law of refraction—refractive index—geometrical construction for refracted ray—effects of refraction—principle of reversibility of light—real and apparent depth—refractive index related to real and apparent depth—to measure refractive index by the real and apparent depth method—total internal reflection, critical angle—relation between critical angle and refractive index—fish's eye view—to measure critical angle and refractive index of the material of a prism—multiple images formed by a thick glass mirror—total internal reflection in prisms—mirage.

248

24. Lenses and optical instruments

Technical terms—lenses compared with prisms—optical centre, focal length—two principal foci—construction of

261

images by a converging lens—image by a diverging lens—solution of problems by graphical construction—magnification—experiments to measure the focal length of a converging lens—power of a lens—projector—camera—eye—defects of vision and their correction—compound microscope—angular magnitude and apparent size—astronomical telescope—optical fibres—optical fibres in telecommunications—sign conventions.

5. Dispersion and colour

277

Newton's prism experiment—improvement on Newton's experiment—production of a pure spectrum, spectrometer—recombination of colours of the spectrum—colour of objects in white light—light filters—appearance of coloured objects in coloured light—primary and secondary colours—mixing coloured lights—mixing coloured pigments—infrared and ultraviolet radiation.

Wave Motion

26. Transverse waves and light

287

Transverse waves—transverse wave model—water waves and light waves—water waves in a ripple tank—stroboscope—reflection of straight and circular waves—refraction of waves at plane and curved boundaries—diffraction—interference—how the wave nature of light was first discovered—interference fringes using Young's slits—ray geometry—measurement of wavelength—wavelength and colour—fringes formed by white light—diffraction grating—relation between angle of diffraction and wavelength—formation of spectrum by diffraction grating—wavelength of light by a simple diffraction grating experiment—higher order spectra from a diffraction grating—electromagnetic waves—inverse square law—attenuation—origin and sources of electromagnetic waves—radar.

27. Longitudinal waves and sound

312

Sound production by vibration—sound waves require a material medium—sound can travel through solids—velocity of sound in water, and in air—factors affecting velocity of sound in air—sound waves—longitudinal wave model (Crova's disc)—reflection of sound—echoes—echelon echo—acoustics of buildings—anechoic and soundproof rooms—velocity of sound by an echo method—echo sounding—clinical and industrial applications of ultrasound.

28. Musical sounds

322

Pitch and frequency—music and noise—musical scales—musical intervals—problem of tuning a keyboard instrument—intensity and loudness of sound—quality or timbre of a musical note—beats.

29. Strings and pipes

328

Stationary waves—sonometer—overtones in a vibrating string—stringed instruments—frequency of a stretched string is inversely proportional to the length ($f \propto 1/l$)—methods of tuning a sonometer—factors affecting

resonance—resonance tube—relation of wavelength—stationary wave in a resonance tube—to measure the velocity of sound in air by means of a resonance tube—resonance in open pipes—organ pipes.

Electricity and Magnetism

30. Magnets

Magnetic poles—magnetic and non-magnetic substances—suspending a magnet, magnetic axis, magnetic meridian—action of one magnet on another—test for polarity—to magnetize a steel bar by an electrical method—to magnetize a steel bar by single and divided touch—consequent poles—induced magnetism—demagnetization—magnetic properties of iron and steel—uses of hard and soft magnetic materials—sintered materials.

31. Magnetic fields

Direction of magnetic flux—magnetic flux patterns by plotting—compass method, and by iron-filings method—earth as a magnet—magnetic declination—inclination or dip—simple dip needle—resolving the earth's field into components—changes in the earth's magnetism—magnetic flux pattern of a bar magnet in the earth's field—neutral points—early theories of magnetism—breaking a magnet—modern views on magnetism—diamagnetism—paramagnetism—ferromagnetism—domain theory of magnetism—magnetization of iron and steel used in building construction—magnetic shielding—keepers.

32. Static electricity

Electric repulsion—positive and negative electricity—action between electric charges—insulators and conductors—experiments with a gold-leaf electroscope—electrostatic induction—eighteenth-century ideas about electricity—electron theory, atomic structure—electrons and protons—electrification by friction—electrons in insulators and conductors—electrons and electrostatic induction—proof plane—charging by induction—electrophorus—source of electric energy from an electrophorus—charging a gold-leaf electroscope by induction—effect of a charged rod on a charged gold-leaf electroscope—need for care when using a gold-leaf electroscope—distribution of charge over the surface of a conductor—no charge on the inside surface of a hollow charged conductor—discharging a charged rod, ions in a flame—ions in the atmosphere—electric machines—action of highly charged points—positive and negative ions in a flame—points as collectors of charge—atmospheric electricity, Franklin's experiments—lightning conductor—electric fields—Faraday's ice-pail experiments—equal and opposite charges are produced by friction.

33. Potential and capacitance

Potential difference—earth at zero potential—absolute zero of potential—potential gradient—potential and the gold-leaf electroscope—potential over the surface of a charged conductor—capacitance—capacitance in electric machines—parallel plate capacitor—factors affecting its capacitance—Leyden jar—practical capacitors.

Voltaic pile—condensing electroscope—simple cell—conventional direction of an electric current—electromotive force—faults of a simple cell—Leclanché cell—dry cell—primary and secondary cells—lead-acid cell—care of lead cells—alkaline batteries.

35. Current, electromotive force and resistance

404

Unit of electric current, the ampere—unit of quantity of electricity, the coulomb—unit of potential difference, volt—electromotive force—resistance—rheostats—Ohm's law—limitations of Ohm's law—effect of temperature on resistance; semiconductors—resistors—electric circuit, use of ammeters and voltmeters—resistors in series and in parallel—special case of two resistors in parallel—internal resistance of a cell—arrangement of cells—"lost volts" when a cell is producing current in a circuit—to measure the internal resistance of a cell.

36. Magnetic effect of an electric current

419

Ampère's swimming rule—Schweigger's galvanometer—magnetic flux pattern due to a current in a long straight wire—Maxwell's screw rule—right-hand grip rule—magnetic flux due to a solenoid—rule for polarity of a coil carrying a current—magnetic flux due to a short circular coil—electromagnet—lifting magnets—electric bell—magnetic relay—magnetic separators—telephone receiver (earpiece)—resultant magnetic flux in a horizontal plane due to the earth, and the current in a long vertical wire—magnetic flux due to current in two vertical parallel wires.

37. Electrolysis

428

Discovery of electrolysis—terms used in connection with electrolysis—Hofmann voltameter—ionic theory—electrolysis of acidified water—electrolysis of copper sulphate solution using platinum or carbon electrodes, and using copper electrodes—applications of electrolysis.

38. The principle of the electric motor

434

Faraday's rotation experiment—kicking wire experiment, force on a conductor in a magnetic field—Fleming's left-hand rule—force on a conductor explained by properties of magnetic field lines—Barlow's wheel—use of mercury in the laboratory—simple electric motor—practical d.c. electric motors—efficiency of an electric motor—back e.m.f. in an electric motor—moving-coil loudspeaker.

39. Galvanometers, ammeters and voltmeters

442

Moving-coil galvanometer—sensitivity of a moving-coil galvanometer—ammeters and voltmeters—construction of an ammeter, use of shunts and multipliers—the multimeter—moving-iron instruments—use of moving-iron instruments for measuring a.c.

40. Measurement of resistance and potential difference

451

To measure resistance by the substitution method—to measure resistance by the ammeter-voltmeter method—resistance of an electric lamp and

other conductors—Wheatstone bridge—metre bridge—factors affecting the resistance of a wire at constant temperature—resistivity—to measure the resistivity of constantan—potentiometer—to compare the e.m.f. of two cells by using a potentiometer—potential divider.

41. Electric light, energy and power 46

Electric arc—filament lamps—discharge lamps—fluorescent lighting—heating by electricity—energy in an electric circuit—calculation of work done by an electric current—electric power—unit of electric energy, kilowatt hour—domestic electric installation—fuses—replacing a fuse—power circuits—wiring a three-pin plug.

42. Electrical calorimetry 47

Specific heat capacity of a metal (solid block method)—specific heat capacity of a liquid—specific heat capacity by the method of mixtures—use of a calibrated calorimeter to measure specific heat capacity—specific latent heat of steam (approximate method)—specific latent heat of steam (more accurate method)—specific latent heat of ice by direct heating—specific latent heat of ice by method of mixtures.

43. Electromagnetic induction 484

Electricity from magnetism—Faraday's experiments—using the earth's magnetic flux to induce a current—Faraday's law of e.m. induction—Lenz's law—direction of induced current in a straight wire—Fleming's right-hand rule (dynamo rule) mutual induction, Faraday's iron ring experiment—application of Lenz's law to the iron ring experiment—self-induction—non-inductive resistance coils—applications of e.m. induction—eddy currents, Waltenhofen's pendulums—induction furnace—speedometer—induction coil—coil ignition—simple alternating current generator—simple direct current generator—d.c. dynamo compared with an electric motor—how to increase the e.m.f. obtained from a simple dynamo—practical dynamos—transformer—energy losses in a transformer—advantage of a.c. over d.c. power transmission—two ways of running a low-voltage lamp from the mains—choke—telephone communication—moving-coil microphone.

Atomic and Nuclear Physics

44. Electrons 509

Discharge tube phenomena—Crookes dark space—Maltese cross tube, cathode rays and their properties—work of Sir J. J. Thomson—specific charge—X-rays—gas-filled X-ray tube—Coolidge hot-cathode tube—applications of X-rays—Edison effect, thermionic emission—what happens inside an electric discharge tube—experimental thermionic electron tubes—cathode ray oscilloscope—to study a.c. waveforms, using a cathode ray oscilloscope—semiconductor diode—characteristic curve for a semiconductor diode—half-wave rectification—full-wave rectification—power pack—smoothing.

45. Atomic structure, the quantum theory and radioactivity 524

Rutherford-Bohr atom—electron shells—how an atom gives out light—radiation and the quantum theory—photoelectric effect and the quantum theory—applications of photoelectricity—positive rays—radioactivity—the Curies discover new radioactive substances—nature of the rays from radioactive substances—Crookes's spinthariscopes, scintillations—Wilson cloud chamber—cloud chamber tracks—measuring the activity of radioactive substances—pulse (Wulf) electroscope—ionization of air by a radioactive source—range of α -particles in air—Geiger-Müller tube—absorption of β -particles by aluminium—deflection of β -particles by a magnetic field—properties of gamma radiation—emergence of ideas on atomic structure—evidence for the nuclear atom—Geiger and Marsden's experiments—Rutherford and Royds's experiment—atomic number and periodic table—problem of nuclear mass, isotopes—mass number, atomic number, nuclide symbols—unified atomic mass unit, binding energy—symbols for protons, neutrons and electrons in nuclear equations.

46. Splitting the nucleus 544

Half-life—laws of radioactive decay—alpha decay—beta decay—how Rutherford first split the atom—cloud chamber studies—Cockcroft and Walton's experiment—equivalence of mass and energy—Van de Graaff particle accelerator—linear accelerator—the synchrotron—discovery of the neutron—disintegration by neutrons—nuclear fission—nuclear weapons—artificial isotopes—radioisotopes in industry—gamma radiography, autoradiography—biological hazards and safety precautions—list of elements.
