MODERN PHYSICS

FOR DEGREE STUDENTS

CONTENTS

CHAPTER	CONTENTS	PAGE
	Preface	1
I.	DISCHARGE OF ELECTRICITY THROUGH GASES	1
	Under normal pressure	1
	Ionisation and ionisation current ; ionisation by collision ; disruptive discharges ; mobility of ions.	2
	At low pressure	14
	Discharge tube phenomena ; cathode rays, positive rays and X-rays.	14
	Practical applications of the discharge tube...	21
	Geissler tube, sodium and mercury vapour lamps, fluorescent lamps.	21
II.	THE ELECTRON	27
	Determination of e/m and e of the electron...	27
	Thomson's, Wilson's and Millikan's experiments ; mass and radius of the electron ; energy of a moving electron.	27
	The electron theory and its applications	42
	Electrical conduction in metals	42
	Thermal conductivity	45
	Magnetic properties of materials	46
	Experimental study :—Faraday, Gouy and Rowland's methods ; results. Theoretical investigations :—Langevin's theory of diamagnetism and paramagnetism ; Weiss molecular field theory of para- and ferro-magnetism	80
	Zeeman effect	80
	Important sources of electrons	84
	Thermionic and photoelectric emissions	84
	Practical appliances of electron beams	95
	Thermionic valves, radar, microwave spectroscopy, cathode ray oscillograph, photoelectric cells, television, electron multiplier, electron microscope.	95
III.	POSITIVE RAYS	244
	Sources of positive rays	245
	Thomson's parabola method of positive rays analysis	245

Mass spectrographs ...	253
Aston's, Dempster's, Bainbridge's and Nier's. Bainbridge and Jordan double-focusing arrange- ment.	
Isotopic constitution of elements ...	264
Number of isotopes ; separation of isotopes ; exact masses of isotopes ; relative abundance of isotopes.	
IV. X-RAYS ...	270
Production of X-rays ...	271
The gas tube ; the Coolidge tube.	
Detection of X-rays ...	273
The ionising power of X-rays ; absorption of X-rays.	
Wave nature of X-rays ...	277
Diffraction—Laue's experiment ; reflection— Bragg's law, Bragg's X-ray spectrometer ; refraction, polarisation and scattering of X-rays.	
Experimental determination of the wave- length of X-rays ...	285
Practical applications of X-rays ...	287
Crystal structure ; industrial and medical appli- cations.	
V. FUNDAMENTAL CONCEPTS OF MODERN PHYSICS ...	297
Relativity ...	297
Origin of the theory of relativity ; Einstein's revolutionary idea about time and space. Special relativity ; equations ; relativity of time, simulta- neity and space ; important conclusions—futility of ether, quantum nature of radiation, variation of mass with velocity, mass-energy equivalence. General relativity.	
Quantum theory of radiation ...	317
Classical theories ; Planck's theory of quanta, nature and properties of the photon. Applications of the quantum theory : photoelectric effect—Ein- stein's photoelectric equation and its experimental verification ; Compton effect, theory and experi- ment.	

	Wave nature of matter ...	336
	Origin—De Broglie's concept of matter waves ; De Broglie wavelength. Diffraction of electrons—experiments of Davisson and Germer ; refraction of electrons ; experiment of G. P. Thomson ; wave nature of material particles—atoms and molecules. Theoretical study of matter waves : Heisenberg's quantum mechanics ; Schroedinger's wave mechanics. Principle of indeterminacy.	
VI.	ATOMIC STRUCTURE AND SPECTRA ...	350
	Atom models ...	352
	Thomson model ...	352
	Rutherford nuclear atom model ...	354
	Bohr atom model ...	360
	Applications of Bohr's theory ...	374
	Excitation and ionisation of atoms ; X-ray spectra ; molecular spectra and Raman effect.	
	Sommerfeld relativistic atom model ...	403
	Vector atom model ...	405
	Quantum numbers ; Pauli's exclusion principle ; electronic structure in atoms ; periodic table. Fine structure of spectral lines ; Stern and Gerlach experiment.	
	Wave mechanical atom model ...	437
VII.	NUCLEAR STRUCTURE AND ENERGY ...	442
	Natural radioactivity ...	442
	Discovery ; initial researches ; α -, β - and γ -rays—their identification and characteristics. Fundamental laws of radioactivity. Uses : radioactive tracers ; industrial and medical applications.	
	Artificial transmutation ...	481
	Discovery. Experimental study ; agents of transmutation ; production of fast projectiles—Van de Graaff high tension generator, Cockcroft-Walton tension multiplier, cyclotron, synchrocyclotron, betatron, proton-synchrotron ; analysis of transmutation—magnetic spectrograph, ionisation chamber, Geiger counters, cloud chamber, photographic emulsion. Results : Important dis-	

CHAPTER**PAGE**

coveries—neutrons, artificial radioactivity and nuclear fission—nuclear energy. Transuranic elements.

Cosmic rays

...

551

Discovery. Apparatus used in cosmic ray researches—Neher's electroscope, coincidence counters, counter-controlled cloud chamber, photographic emulsion and bubble chamber. Investigations on the nature of cosmic rays: latitude, longitude, azimuth and altitude effects; energy measurement. Important discoveries—positrons, mesons, showers. Nature and origin of cosmic rays.

Structure and properties of the nucleus

...

577

Theories of nuclear structure: proton electron and proton-neutron composition. Nuclear size, charge, mass and spin. Nuclear forces.
