

Cell & Molecular Biology

8th Edition

CONTENTS

Chapter 1 THE CELL—STRUCTURAL ORGANIZATION	1
1-1 Levels of Organization in Biology	3
Levels of Organization and Instrumental Resolving Power	3
Summary: Levels of Organization	5
1-2 History of Cell and Molecular Biology	5
The Development of the Cell Theory	5
The Development of Submicroscopic and Molecular Biology	6
Summary: Modern Cell Biology	6
1-3 General Organization of Prokaryotic Cells	7
Cell Organization and the Energy Cycle	7
<i>Escherichia coli</i> (<i>E. coli</i>)—The Most Studied Prokaryote	8
Summary: General Organization of Prokaryotic Cells	10
1-4 Mycoplasmas, Viruses, and Viroids	11
Summary: Mycoplasmas, Viruses, and Viroids	12
1-5 General Organization of Eukaryotic Cells	12
Morphological Diversity of Eukaryotic Cells	15
The Cell Membrane	15
1-6 The Nucleus and the Cell Cycle	16
Mitosis and Meiosis—Essentials	18
Summary: Essentials about Nucleus and Chromosomes	20
1-7 The Ultrastructure of the Cytoplasm	21
The Cytoskeleton—Microtubules, Microtubular Organelles, Microfila- ments, and Intermediate Filaments	21
The Endomembrane System—Nuclear Envelope, Endoplasmic Reticu- lum, and Golgi Complex	22
Membrane Organelles—Mitochondria, Chloroplasts, Lysosomes, and Peroxisomes	22
Summary: Ultrastructure of the Cytoplasm	25

1-8 Literary Sources in Cell and Molecular Biology

Additional Readings

Chapter 2 MOLECULAR ORGANIZATION OF THE CELL

2-1 Water, Salts, Ions, and Trace Elements in Cells

2-2 Nucleic Acids

Nucleic Acids—A Pentose, Phosphate, and Four Bases

DNA Base Composition— $A = T$ and $G = C$

DNA Is A Double Helix

Right-Handed B- and A-DNA and Left-Handed Z-DNA

DNA Strands Can Be Separated and Annealed

Circular DNA—Supercoiled Conformation

RNA Structure—Classes and Conformation

Summary: Nucleic Acids

2-3 Carbohydrates

Glycoproteins—Two-step Carbohydrate Addition

2-4 Lipids

Triglycerides—Three Fatty Acids Bound to Glycerol

Phospholipids and Biological Membranes

2-5 Proteins

Proteins—Chains of Amino Acids Linked by Peptide Bonds

Four Levels of Structure in Proteins

Factors Involved in Determining Protein Structure

Electrical Charges of Proteins and the Isoelectric Point

Separation of Cell Proteins—Isoelectric Focusing and SDS

Electrophoresis

Summary: Molecular Components of the Cell

2-6 Enzymes and Their Regulation

Some Enzymes Require Cofactors or Coenzymes

Substrates Bind to the Active Site

Essentials of Enzyme Kinetics— K_m and V_{max} Define Enzyme

Behavior

Enzyme Inhibitors Can Be Very Specific

Zymogens Are Inactive Forms of Enzymes

Isoenzymes

The Cell Is Not Simply A Bag Full of Enzymes

Some RNAs Have Enzymatic Activity—Ribozymes

Cooperativity and Allosterism in Enzyme Kinetics

Enzyme Regulation at the Genetic and Catalytic Levels

Cyclic AMP—The Second Messenger in Hormone Action

Calcium, Calmodulin, and Regulation of Cellular Functions

Summary: Enzymes in the Cell

2-7 The Assembly of Macromolecules and the Origin of Cells

Proteins and Nucleic Acid May Self-Assemble

The Origin of Cells

Summary: Assembly of Macromolecules and the Origin of Life

Additional Readings	71
Chapter 3 TECHNIQUES IN CELL BIOLOGY	71
3-1 Various Types of Light Microscopy	73
Light Microscope—Resolving Power	74
Phase and Interference Microscopy—Detect Small Differences in Refractive Index	74
Darkfield Microscopy—Based on Light Scattering at Cell Boundaries ..	75
Polarization Microscopy—Detects Anisotropy with Polarized Light	76
3-2 Electron Microscopy	77
Thin Specimens—Essential for EM Study	78
Shadow Casting, Negative Staining, and Tracers—Increased Contrast ..	78
Freeze-Fracturing—Membranes Split at Cleavage Planes	80
Preparation of Thin Sections—Epoxy Resins and Ultramicrotomes	80
High Voltage EM—Allows Study of Thicker Specimens	80
Scanning EM and Scanning Transmission EM (STEM)	82
Image Reconstruction from Electron Micrographs	83
Summary: Microscopy:	83
3-3 Study of the Living Cell	84
3-4 Fixation and Staining	85
Freeze-drying and Free-substitution	85
Microtomes and Embedding	85
Chemical Basis of Staining	86
Metachromasia—A Change in Original Dye Color	87
Summary: Observation of Living and Fixed Cells	87
3-5 Cytochemical Methods	89
Schiff's Reagent—Detection of Aldehydes—Cytochemistry of Nucleic Acids	89
Lipids—Detection by Lipid-soluble Stains	91
Enzymes—Detection by Incubation with Substrates	91
Cytophotometric Methods	93
Fluorescence Microscopy—Autofluorescence and Fluorochrome Dyes ..	93
3-6 Immunocytochemistry	94
3-7 Radioautography	96
3-8 Cell Fractionation	98
Differential or Gradient Centrifugation	99
Flow-sorting Cytometry	101
Summary: Cytochemistry	101
Additional Readings	102
Chapter 4 CELL MEMBRANE AND PERMEABILITY	103
4-1 Molecular Organization of the Cell Membrane	104
The Cell Membrane—Composed of Proteins, Lipids, and Carbohydrates	104
Lipids Are Asymmetrically Distributed within the Bilayer	104
Carbohydrates—In the Form of Glycolipids and Glycoproteins	106
Membrane Proteins—Peripheral or Integral	106

	Every Protein of the Cell Membrane Is Distributed Asymmetrically	108
	Major Polypeptides of the Red Cell Membrane and Cytoskeleton	108
	Asymmetrical Distribution of Enzymes	111
	Summary: Molecular Organization of the Cell Membrane	112
4-2	Molecular Models of the Cell Membrane	112
	Artificial Model Systems—Liposomes	112
	The Unit Membrane Model—Reevaluation of the Electron Microscopic Image	114
	The Fluid Mosaic Model—Generally Accepted	115
	Membrane Fluidity and Membrane Fusion	116
	The Mobile Hypothesis of Receptors	118
	Summary: Membrane Molecular Models	119
4-3	Cell Permeability	120
	Passive Permeability—Concentration Gradient and Partition Coefficient	120
	Passive Ionic Diffusion—Dependent on the Concentration and Electrical Gradients	121
	Active Transport—The Sodium Pump	122
	Ionic Transport through Charged Pores in the Membrane	123
	Anion Transport in Erythrocytes Involves the Special Band-3 Polypeptide	124
	Vectorial Function of $\text{Na}^+\text{K}^+\text{ATPase}$ and Sodium Transport	124
	Transport Proteins—Carrier and Fixed Pore Mechanisms	126
	Summary: Cell Permeability	128
	References	129
	Additional Readings	129
Chapter 5	CELLULAR INTERACTIONS	130
5-1	Differentiations of the Cell Membrane	130
	Microvilli—A Greatly Increased Cell Membrane Surface Area	132
	Tight Junctions and the Sealing of Epithelia	132
	Belt and Spot Desmosomes—Mechanical Function	134
	Summary: Differentiations of the Cell Membrane	135
5-2	Intercellular Communications and Gap Junctions	135
	Electrical Coupling between Cells Depends on Gap Junctions	135
	The Connexon—Opening and Closing of the Channel	136
	Gap or Communicating Junctions—Permeability to Ions and Small Molecules	138
	Coupling between Cells Enables Metabolic Cooperation	139
	Altered Coupling in Cancer Cells	139
	Summary: Gap Junctions and Intercellular Communications	140
5-3	Cell Coat and Cell Recognition	141
	Glycosaminoglycans and Proteoglycans as Extracellular Materials	142
	Functions Attributed to the Cell Coat	143
	Factors Mediating Cell-Self Recognition—The Aggregation Factor of Sponges	143
	Animal Cell—Recognition Molecules	145
	Cellular Interactions and Cyclic AMP	146
	Summary: Cell Coats and Cell Recognition	146

5-4	The Cell Surface of Cancer Cells	147
	Surface Changes in Cancer Cells	147
	Cancer Cells and Iron Transport	148
	Fibronectin and the Cancer Cell	148
	Loss of Control of Growth in Cancer Cells	149
	Viruses as Oncogenic Agents	151
	Summary: Cell Surface in Cancer Cells	152
	References	152
	Additional Readings	153

Chapter 6 THE CYTOSKELETON AND CELL MOTILITY—MICROTUBULES, MICROFILAMENTS, AND INTERMEDIATE FILAMENTS **154**

6-1	Cytosol, Ergastoplasm, and Cytoskeleton	155
	Summary: The Cytoskeleton	157
6-2	Microtubules	158
	Tubulin—The Main Protein of Microtubules	158
	Microtubules—Assembly from Tubulin Dimers and Polarity	160
	Detection of Microtubules by Antibodies	161
	Functions of Cytoplasmic Microtubules	162
	Summary: Properties of Microtubules	163
6-3	Microtubular Organelles—Cilia, Flagella, and Centrioles	163
	Ciliary and Flagellar Motions in Cells and in Tissues	163
	The Ciliary Apparatus—The Cilium, Basal Bodies, and Ciliary Rootlets	164
	The Axoneme Contains Microtubular Doublets	164
	Basal Bodies (Kinetosomes) and Centrioles Contain Microtubular Triplets	165
	Ciliary Movement	167
	A Sliding of Microtubular Doublets that Involves Dynein	169
	The Immotile Cilia Syndrome	170
	Photoreceptors are Derived from Cilia	171
	Cilia and Flagella Originate from Basal Bodies	171
	Summary: Structure, Motion, and Origin of Cilia and Flagella	174
6-4	Microfilaments	174
	Microtrabecular Lattice—Revealed by High-Voltage Electron Microscopy	175
	Cytochalasin B Impairs Several Cellular Activities Involving Microfilaments	176
	Microfilaments Detected by Specific Antibodies—The Cellular Geodome	176
	The Contractile Machinery in Nonmuscle Cells	180
	Summary: Microfilaments	181
6-5	Microfilaments and Cell Motility	181
	Cytoplasmic Streaming (Cyclosis)—Observed in Large Plant Cells	181
	Ameboid Motion—Characteristic of Amebae and Many Free Cells	185
	Interaction of Microfilaments with the Cell Membrane and Surface Receptors	187
	Cell Adhesion, Focal Contacts, Stress Fibers, Fibronexus, and Transmembrane Interaction	187

	Cell Adhesion and Collagens	190
	Microtubules and Microfilaments in Cancer Transformation	191
	Summary: Microfilaments and Cell Motility	192
6-6	Intermediate Filaments—Mechanical Integrators of Cellular Compartments	194
	Intermediate Filaments During Mitosis	195
	Summary: Intermediate Filaments	196
	References	196
	Additional Readings	197
Chapter 7 CELLULAR AND MOLECULAR BIOLOGY OF MUSCLE		
7-1	Structure of the Striated Muscle Fiber	198
	The Myofibril and Sarcomere are Structures Differentiated for Contraction	200
	Thick and Thin Myofilaments Are the Macromolecular Contractile Components	201
	The Z-disc Shows a Woven-Basket Lattice and Contains α -Actinin, Desmin, Vimentin, and Synemin	202
	The Sarcomere I-Band Shortens and the Banding Inverts During Contraction	202
	Smooth Muscles Lack the Z-disc	203
	Summary: The Structure of Muscle	204
7-2	Molecular Organization of the Contractile System	205
	The Thick Myofilament—Myosin Molecules; The Cross-Bridges— S_1 Subunits	205
	Actin, Tropomyosin, and the Troponins Constitute the Thin Myofilament Structural Proteins	207
7-3	The Sliding Mechanism of Muscle Contraction	208
	Myosin and Actin Have a Definite Polarization within the Sarcomere ..	208
	Muscle Contraction—A Cyclic Formation and Breakdown of Actin-Myosin Linkages	209
	Summary: Molecular Organization and the Sliding Mechanism	210
7-4	Regulation and Energetics of Contraction	210
	Molecular Regulation—Displacement of Tropomyosin After Binding of Ca^{++} to Troponin-C	211
	Energy for Contraction Comes from Oxidative Phosphorylation and Glycolysis	211
	Summary: Regulation and Energetics of Contraction	212
7-5	Excitation-Contraction Coupling	212
	The SR—A Longitudinal Component with Terminal Cisternae that Form Part of the Triad	212
	The T-System is in Continuity with the Plasma Membrane and Conducts Impulses Inward	212
	Stimulation Releases Ca^{++} from the Terminal Cisternae	214
	A Ca^{++} -Activated ATPase is Present in the SR and Acts as a Ca^{++} Pump	214
	Summary: Excitation-Contraction Coupling and the SR	216

References	216
Additional Readings	216
Chapter 8 ENDOPLASMIC RETICULUM AND PROTEIN SEGREGATION	218
8-1 General Morphology of the Endomembrane System	219
The RER—Ribosomes and Protein Synthesis	219
Ribosomal Binding to the ER—60S Subunit and Ribophorins Involved	223
The SER Lacks Ribosomes-Glycosomes	224
Summary: The Endoplasmic Reticulum	224
8-2 Microsomes—Biochemical Studies	224
Microsomal Membranes—A Complex Lipid and Protein Composition	225
Two Microsomal Electron Transport Systems—Flavoproteins and Cytochromes b_5 and P-450 Involved	227
Microsomal Enzymes—Glycosidation and Hydroxylation of Amino Acids	227
Summary: Microsomes	228
8-3 Biogenesis and Functions of the ER	228
Membrane Biogenesis Involves a Multi-Step Mechanism	228
ER-Membrane Fluidity and Flow Through the Cytoplasm	229
Ions and Small Molecules—Transport Across ER Membranes	229
Special Functions of the SER—Detoxification, Lipid Synthesis, and Glycogenolysis	229
Summary: Biogenesis and Functions of the ER	230
8-4 The ER and Synthesis of Exportable Proteins	230
The Signal for Secretory Proteins Resides in the Nascent Polypeptide: The Signal Theory	231
The Hydrophobic Signal Peptide is Removed by a Signal Peptidase	231
The Role of the Signal Recognition Particle (SRP)	233
Protein Secretion in Bacteria Uses a Signal Peptide	234
Summary: Synthesis of Exportable Proteins—The Signal Hypothesis	235
8-5 Protein Segregation	235
Cotranslational and Postranslational Translocation of Proteins— Segregation Sequences	237
Synthesis and Assembly of Membrane Proteins—Stop Transfer Sequences	237
Summary: Protein Segregation	239
References	240
Additional Readings	240
Chapter 9 GOLGI COMPLEX AND CELL SECRETION	241
9-1. Morphology of the Golgi Complex (Dictyosomes)	243
Dictyosomes—A Forming Face, and a Maturing Face Near the GERL	245
Polarization of Dictyosomes and Membrane Differentiation	245
Summary: Morphology of the Golgi Complex	245

9-2	Cytochemistry of the Golgi Complex	
	Chemical Composition of the Golgi Complex—Intermediate Between	245
	Those of the ER and the Plasma Membrane	
	Glycosyl Transferases are Concentrated in the Golgi	246
	Summary: Cytochemistry of the Golgi Complex	247
9-3	Functions of the Golgi Complex	
	Synthesis of Glycosphingolipids and Glycoproteins—A Major Role of	248
	the Golgi	
	Cancer Cells—Changes in Glycosidation of Lipids and Proteins	251
9-4	Secretion—The Main Function of the Golgi Complex	
	The Secretory Cycle—Continuous or Discontinuous	252
	The Secretory Process in the Pancreas—Six Consecutive Steps	254
	Endocytosis and Recycling of Membranes of Secretory Granules	256
	The GERL Region and Lysosome Formation	259
	Compartments of the Golgi Apparatus	259
	Insulin Biosynthesis—A Good Example of the Molecular Processing of	
	Secretion	262
	Summary: Functions of the Golgi Complex	264
	References	265
	Additional Readings	265

Chapter 10	LYSOSOMES, ENDOCYTOSIS, COATED VESICLES, ENDOSOMES, AND PEROXISOMES	267
10-1	Major Characteristics of Lysosomes	268
	Various Cytochemical Procedures for Identifying Lysosomes	269
	Lysosomes are Very Polymorphic	269
	Primary Lysosomes and Three Types of Secondary Lysosomes	
	Lysosomal Enzymes—Synthesized in the ER, Packaged in the Golgi—	272
	The Mannose-6-Phosphate Receptor	273
	Summary: Lysosomal Morphology and Cytochemistry	274
10-2	Functions of Lysosomes—Intracellular Digestion	
	Autophagy by Lysosomes—The Renovation and Turnover of Cell	274
	Components	
	Lysosomal Removal of Cells and Extracellular Material and Develop-	274
	mental Processes	
	Release of Lysosomal Enzymes to the Medium for Extracellular Action	274
	Lysosomal Enzyme Involvement in Thyroid Hormone Release and in	
	Crinophagy	275
	Leukocyte Granules Are of a Lysosomal Nature	275
	Lysosomes Are Important in Germ Cells and Fertilization	275
	Lysosomal Involvement in Human Diseases and Syndromes	275
	Storage Diseases—Caused by Mutations That Affect Lysosomal	
	Enzymes	275
	Lysosomes in Plant Cells and Their Role in Seed Germination	276
	Summary: Functions of Lysosomes	277
10-3	Endocytosis	277
	Phagocytosis—The Process of Cellular Ingestion of Solid Material	277
	Pinocytosis—The Ingestion of Fluids	277

Micropinocytosis and the Ingestion and Transport of Fluids	278
Endocytosis—An Active Mechanism Involving the Contraction of Microfilaments	278
Summary: Endocytosis and Lysosomes	279
10-4 Coated Vesicles and Receptor-Mediated Selective Transport	279
The Coat is Made of Clathrin	279
Functions of Coated Vesicles—Receptor-Mediated Endocytosis	280
Coated Vesicles and Intracellular Traffic	283
The Endosome and the Sorting of Ligands and Receptors	284
Summary: Coated Vesicles and Selective Transport	285
10-5 Peroxisomes	285
Morphology of Peroxisomes and Microperoxisomes	286
Biogenesis of Peroxisomes—A Mixed Model	286
Peroxisomes Contain Enzymes Related to the Metabolisms of H_2O_2 and β -Oxidation	287
Plant Peroxisomes Are Involved in Photorespiration	288
Summary: Peroxisomes	289
References	289
Additional Readings	289
Chapter 11 MITOCHONDRIA AND OXIDATIVE PHOSPHORYLATION	291
11-1 Morphology of Mitochondria	293
Summary: Mitochondrial Morphology	294
11-2 Mitochondrial Structure	294
F_1 Particles—On the M Side of the Inner Mitochondrial Membrane ...	295
Mitochondrial Structural Variations in Different Cell Types	296
Mitochondrial Sensitivity to Cell Injury and Resultant Degeneration ...	298
Summary: Structure of Mitochondria	298
11-3 Isolation of Mitochondrial Membranes	298
Outer and Inner Membranes—Structural and Chemical Differences ...	298
Mitochondrial Enzymes Are Highly Compartmentalized	299
The Inner Membrane—Regional Structural and Enzymatic Differences	300
Summary: Isolation of Mitochondrial Membranes	301
11-4 Bioenergetics: Molecular Organization and Function of Mitochondria ...	301
Entropy is Related to the Degree of Molecular Order	302
Chemical Energy and ATP	302
Glycolysis—First Step in the Release of Energy	303
Coenzymes Play a Central Role in Mitochondria	303
The Krebs Cycle—A Common Pathway in the Degradation of Fuel Molecules	305
Electrons Flow Along a Cytochrome Chain Having a Gradient of Redox Potential	306
The Respiratory Chain—Four Molecular Complexes	308
Electron Transport—Coupled to the Phosphorylation at Three Points ..	311
Mitochondrial ATPase—A Structurally Complex Proton Pump	311
Topological Organization of the Respiratory Chain and the Phosphoryl- ation System	312

The Chemiosmotic Theory—An Electrochemical Link Between Respiration and Phosphorylation	91
The Chemical-Conformational Hypothesis Involves Short-Range Interactions	94
Overall Energy Balance—Glucose and the P/O Ratio	94
Summary: Molecular Organization and Function	94
11-5 Permeability of Mitochondria	94
ADP, ATP, and Pi—Transport by Specific Carriers	94
Mitochondrial Conformation—Changes with Stages of Oxidative Phosphorylation	94
Mitochondrial Swelling and Contraction—Agent-Induced	94
Mitochondrial Accumulation of Ca^{++} and Phosphate	94
Summary: Mitochondrial Permeability	94
11-6 Biogenesis of Mitochondria	94
Mitochondria are Semiautonomous Organelles	94
Mitochondrial DNA—Circular and Localized in the Matrix	94
Mitochondrial Ribosomes—Smaller than Cytoplasmic Ribosomes	94
Mitochondria Synthesize Mainly Hydrophobic Proteins	94
The Symbiont Hypothesis—Mitochondria and Chloroplasts are Intracellular Prokaryotic Parasites	94
Summary: Mitochondrial Biogenesis	94
References	94
Additional Readings	94
Chapter 12 PLANT CELL—CHLOROPLAST AND PHOTOSYNTHESIS	94
12-1 The Cell Wall of Plant Cells	94
The Cell Wall—A Network of Cellulose Microfibrils and a Matrix	94
Development of Primary and Secondary Walls and Plant Cell Differentiation	94
Cell Wall Components—Synthesis Associated with the Golgi or the Plasma Membrane	94
Plasmodesmata Establish Communication Between Adjacent Cells	94
Summary: The Plant Cell Wall	94
12-2 Plant Cell Cytoplasm	94
Mitochondria Can be Distinguished from Proplastids	94
Seed Development—Cell Division, Cell Expansion, and a Drying Phase	94
Seed Germination Involves Synthesis of Hydrolytic Enzymes	94
Glyoxysomes—Organelles Related to Triglyceride Metabolism	94
Summary: Plant Cell Cytoplasm	94
12-3 The Chloroplast and Other Plastids	94
Chloroplast Morphology Varies in Different Cells	94
Chloroplast Structure—Envelope, Stroma, and Thylakoids	94
12-4 Molecular Organization of Thylakoids	94
Several Chlorophyll-Protein Complexes in Thylakoid Membranes	94
Freeze-Fracturing Best Reveals the Fine Structure of the Thylakoid Membrane	94
Summary: Structure and Molecular Organization of Chloroplasts	94

12-5	Photosynthesis	342
	Pigment Molecules are Photoexcited	343
	Primary Reaction of Photosynthesis—Photochemical Reaction	343
	Electron Transport Chain—Cytochromes, Plastoquinone, and Ferrodoxin	344
	Topology of the Electron Transport and Photosystems	344
	Photophosphorylation Involves a CF_1 ATPase—The Chemiosmotic Coupling	345
	The Photosynthetic Carbon-Reduction (PCR) Cycle—Dark Reactions ..	346
	The C_4 -Pathway in Angiosperms	347
	Ion Fluxes and Conformational Changes—Caused by Light and Darkness	348
	Summary: Photosynthesis and the Chloroplast	349
12-6	Biogenesis of Chloroplasts	349
	Chloroplasts as Semiautonomous Organelles	350
	Summary: Biogenesis of Chloroplasts	353
	References	353
	Additional Readings	354
apter 13	THE INTERPHASE NUCLEUS, CHROMATIN, AND THE CHROMOSOME	355
13-1	The Interphase Nucleus	356
	Ultrastructure of the Interphase Nucleus	358
13-2	The Nuclear Envelope	359
	Nuclear Pores Are Not Wide-Open Channels	360
	Annulated Lamellae—Cytoplasmic Stores of Pore Complexes	360
	The Nuclear Lamina Depolymerizes During Mitosis	363
	Interphase Nuclei Can Be Assembled from Bacteriophage λ DNA	363
	Nuclear Pores Are a Selective Diffusion Barrier Between Nucleus and Cytoplasm	363
	Nuclear Proteins Accumulate Selectively in the Nucleus	365
	Cells Use Multiple Mechanisms to Segregate Proteins into Cellular Compartments	369
	Summary: The Nuclear Envelope	370
13-3	Chromatin	370
	The C-Value Paradox	371
	Chromatin Is a Complex of DNA and Histones	371
	Electron Microscopy of Chromatin Spreads Revealed a Beaded Structure	371
	The Nucleosome—An Octamer of Four Histones (H2A, H2B, H3, and H4) Complexed with 200 Base Pairs of DNA	372
	The 30 nm Fiber—A Nucleosome Solenoid	373
	Bacterial Chromosomes Are Not Complexed with Histones	376
	Chromatin Structure of Active Genes	376
	Summary: Chromatin	377
13-4	The Chromosomes	378
	Chromosomal Shape is Determined by the Position of the Centromere ..	378
	Chromosomal Nomenclature—Chromatid, Centromere, Telomere, Satellite, Secondary Constriction, Nucleolar Organizer	378

Karyotype—All the Characteristics of a Particular Chromosomal Set	378
Each Chromatid Has a Single DNA Molecule	380
Metaphase Chromosomes are Symmetrical	380
Centromeric DNA Has Conserved Sequences	380
Chromosome Ends Can Be Cloned in Linear DNA Vectors in Yeast	381
Interphase Chromosomal Arrangement—Random or Non-random?	382
Chromosomes Are Made of Radial Loops of 30 nm Chromatin Fibers	383

13-5 Heterochromatin	387
Heterochromatin—Chromosomal Regions That Do Not Decondense	387
During Interphase	387
Heterochromatin Can Be Facultative or Constitutive	387
Heterochromatin is Genetically Inactive	387
Constitutive Heterochromatin Contains Repetitive DNA Sequences	389
Summary: The Chromosomes and Heterochromatin	390
References	391
Additional Readings	391

Chapter 14 THE CELL CYCLE 394

14-1 The Cell Cycle	395
Interphase—The G ₁ , S, and G ₂ Phases	395
G ₁ —The Most Variable Period of the Cell Cycle	395
Visualization of Chromosomes During G ₁ , S, and G ₂ by Premature	397
Condensation	397
Condensed Chromosomes do not Synthesize RNA	397
Several Molecular Events Occur at Defined Stages of the Cell Cycle	399
A Cytoplasmic Clock Times the Cell Cycle in Early Embryogenesis	401
Polypeptide Growth Factors Control Cell Proliferation	403
Summary: The Cell Cycle	403

14-2 DNA Replication	404
DNA Replication is Semiconservative	405
DNA Synthesis is Discontinuous on One Strand	406
Okasaki Fragments Start with an RNA Primer	407
Helix-Destabilizing Proteins and DNA Topoisomerases are Required for	408
Replication	408
Reverse Transcriptase Can Copy RNA into DNA	409
Replication of the <i>E. coli</i> Chromosome is Bidirectional	410
Eukaryotic Chromosomes Have Multiple Origins of Replication	410
Eukaryotic DNA Synthesis is Bidirectional	411
The Number of Replicons is Developmentally Regulated	411
Eukaryotic Origins of Replication and the ARSes of Yeast	411
Reinitiation Within the Same Cycle is Prevented in Eukaryotic Cells	412
New Nucleosomes are Assembled Simultaneously with DNA	413
Replication	415
RNA Synthesis Continues During DNA Replication	416
DNA Repair Enzymes Remove Thymine Dimers Induced by Ultraviolet	416
Light— <i>Xeroderma Pigmentosum</i>	416
Summary: DNA Replication	416

References	416
Additional Readings	417

Chapter 15 MITOSIS AND CELL DIVISION

15-1 A General Description of Mitosis	418
Prophase—Chromatid Coiling, Nucleolar Disintegration, and Spindle Formation	418
Metaphase—Chromosomal Orientation at the Equatorial Plate	420
Anaphase—Movement of Daughter Chromosomes toward the Poles	420
Telophase—Reconstruction of the Daughter Nuclei	421
Cycle of the Centrioles	421
Summary: Events in Mitosis	422
15-2 Molecular Organization and Functional Role of the Mitotic Apparatus	423
Centromere or Kinetochore—Microtubule Implantation Sites	424
Spindle Microtubules—Kinetochores, Polar and Free	426
Assembly and Polarity of Spindle Microtubules	427
Metaphase Chromosomal Motion—Caused by Kinetochore and Polar Microtubular Interaction	429
Anaphase Chromosomal Movement	430
Hypotheses about the Mechanisms of Anaphase Movements	432
The Nuclear Envelope and the Lamina Are Reformed at Telophase	433
Cytokinesis in Animal Cells—A Contractile Ring of Actin and Myosin	433
Cytokinesis in Plant Cells—The Phragmoplast and Cell Plate	434
Summary: The Mitotic Apparatus	436
References	437
Additional Readings	437

Chapter 16 MEIOSIS AND SEXUAL REPRODUCTION

16-1 A Comparison of Mitosis and Meiosis	440
16-2 A General Description of Meiosis	441
Leptotene Chromosomes Appear to be Single and Have Chromomeres	441
Zygonema—Pairing of Homologous Chromosomes and Synaptonemal Complex Formation	442
Methods to Study Synaptonemal Complexes	445
The Synaptonemal Complex and Homologue Alignment	446
Organization of Chromatin in Early Meiotic Prophase	446
Pachynema—Crossing-Over and Recombination between Homologous Chromatids	448
The Recombination Nodule in the SC is Probably Related to Crossing-Over	448
Diplonema—Separation of the Paired Chromosomes Except at the Chiasmata	450
Diakinesis—Reduction in the Number of Chiasmata	450
Meiotic Division I—Separation of the Homologous Kinetochores	452
Meiotic Division II—Separation of the Sister Kinetochores	452
Chromosome Distribution in Mitosis and Meiosis is Dependent on Kinetochore Orientation	452
Summary: Events in Meiosis	453

16-3	Genetic Consequences of Meiosis and Types of Meiosis	464
	Meiosis is Intermediary or Sporic in Plants	464
	Meiosis May Last for 50 Years in the Human Female	464
	Meiosis Starts after Puberty in the Human Male	464
	Cell Biology of Fertilization	464
	Changes in the Nuclear Lamina in Meiosis	464
	Summary: More about Meiosis	464
16-4	DNA Metabolism in Meiosis	465
	Proteins Involved in Meiotic DNA Metabolism	465
	Summary: DNA and Proteins in Meiosis	465
	References	465
	Additional Readings	465
Chapter 17 CYTOGENETICS—CHROMOSOMES AND HEREDITY		
17-1	Mendelian Laws of Inheritance	465
	The Law of Segregation—Genes Are Distributed without Mixing	465
	Independent Assortment—Genes in Different Chromosomes Are Distributed Independently during Meiosis	466
	Genes are Linked When They Are on the Same Chromosome	466
	Linkage May be Broken by Recombination during Meiotic Prophase	467
	Neurospora—Ideal for Studying Recombination and Gene Expression	468
	Summary: Fundamentals of Genetics	469
17-2	Chromosomal Changes and Cytogenetics	470
	Euploidy—A Change in the Number of Chromosome Sets; Aneuploidy—A Loss or Gain of Chromosomes	470
	Aneuploidy—The Result of Nondisjunction at Meiosis or Mitosis	471
	Chromosomal Aberrations—Structural Alterations; Gene Mutations—Molecular Changes	472
	Radiation and Chemical Mutagens Act Mainly at the DNA Molecule	473
	Germ Cell Mutations Are Transmittable and Somatic Are Not	473
	Intra- and Interchromosomal Aberrations	475
	Sister Chromatid Exchanges Increase in Diseases with Altered DNA Repair	476
17-3	Chromosomes Play a Fundamental Role in Evolution	477
	The Evolution of Chromosomes in Primates	479
	Summary: Chromosomal Aberrations, Action of Mutagens, Cytogenetics and Evolution	479
	References	480
	Additional Readings	481
Chapter 18 HUMAN CYTOGENETICS		
18-1	The Normal Human Karyotype	483
	Karyotype Preparation—Chromosomal Ordering by Size and Kinetochore Position	483
	Banding Techniques Reveal Structural Details of Chromosomes	484
	Banding Provides New Features for Identification of Human Chromosomes	486
	Summary: The Human Karyotype	486

18-2	Sex Chromosomes and Sex Determination	487
	X and Y Sex Chromatin in Interphase Nuclei	487
	X Chromatin and X Chromosome Inactivation	489
	Y Chromatin—The Heterochromatic Region of the Y Chromosome	491
	Sex is Determined by Sex Chromosomes, but Hormones Influence Differentiation	491
	Summary: Sex Chromosomes and Sex Determination	492
18-3	Human Chromosomal Abnormalities	492
	Aneuploidy—Caused by Nondisjunction of Chromosomes	493
	Reciprocal Translocations—Identified by Banding	494
	Sex Chromosome Abnormalities in Human Syndromes	494
	Mongolism—The Best Known Autosomal Abnormality	496
	Structural Aberrations May Cause Other Syndromes	497
	Banding Techniques Have Detected More Than 30 New Syndromes ..	497
	Chromosome Aberrations in Cancer, Fragile Sites and Oncogenes	497
	Summary: Chromosomal Abnormalities	499
18-4	Human Chromosomes and the Genetic Map	500
	Daltonism and Hemophilia—The Best Known Sex-Linked Diseases ...	500
	Somatic Cell Genetics and Chromosome Mapping	500
	Selection of Hybrids and Gene Mapping	502
	Nucleic Acid Hybridization and Gene Mapping	503
	Progress in Human Gene Mapping	503
	Summary: The Human Genetic Map	504
	References	504
	Additional Readings	504

Chapter 19 THE GENETIC CODE AND GENETIC ENGINEERING **506**

19-1	The Genetic Code	507
	Genes Are Made of DNA	507
	Three Nucleotides Code for One Amino Acid	508
	Artificial mRNAs Were Used to Decipher the Genetic Code	509
	Synonyms in the Code—61 Codons for 20 Amino Acids	510
	AUG—The Initiation Codon; UAG, UAA, and UGA—Termination Codons	511
	The Genetic Code is Universal, Except for Mitochondria	511
	Mutations Produce Amino Acid Changes	512
	Suppressor Mutations—tRNA Mutations	512
	Summary: The Genetic Code	513
19-2	DNA Sequencing and Genetic Engineering	514
	DNA Sequencing Confirmed the Code	514
	The 5375-Nucleotide Sequence of ϕ X174 Revealed Overlapping Genes ..	515
	Some Codons Are Used Differently in Mitochondrial DNA	516
	Recombinant DNA Allows the Study of Complex Genomes	519
	Restriction Endonucleases Recognize Specific DNA Sequences	519
	Eukaryotic Genes Can be Introduced into Plasmids and Cloned in <i>E. coli</i>	520
	Genetic Engineering and Industrial Production of Valuable Proteins ...	522
	A New Type of Genetic Analysis has Become Possible	524
	Summary: DNA Sequencing and Genetic Engineering	524

Additional Readings

Chapter 20 TRANSCRIPTION AND PROCESSING OF RNA

20-1	Transcription in Prokaryotes and Eukaryotes	
	Prokaryotic RNAs Are Transcribed by a Single RNA Polymerase	528
	In Prokaryotes Transcription is Coupled to Protein Synthesis	530
	Eukaryotes Have Three RNA Polymerases	530
	Transcription May be Visualized by Electron Microscopy	531
	Summary: Transcription in Prokaryotes and Eukaryotes	533

20-2	Eukaryotic Messenger RNA Biosynthesis	
	mRNA Has Noncoding Regions	534
	The 5' End of Eukaryotic mRNA is Blocked by 7-Methylguanosine	536
	The 3' End of Eukaryotic mRNA—A Poly A Segment	536
	Eukaryotic Genes Are Frequently Interrupted by Intervening Sequences	537
	Splice Junctions Have Conserved Sequences that Are Recognized by U1-snRNPs	538
	<i>Tetrahymena</i> rDNA Can Splice Itself in the Absence of Proteins	541
	Splicing in Prokaryotes	542
	Why Have Splicing?	542
	An RNA Polymerase II Promoter Consists of a TATA Box, a CAAT Box, and an Enhancer	543
	3' End Maturation Involves Cleavage of Longer Precursors Followed by Polyadenylation	544
	Three-Quarters of the Heterogeneous Nuclear RNA (hnRNA) Is Destroyed within the Nucleus	546
	hnRNA and mRNA Are Associated with Proteins	546
	Alternative RNA Processing Can Regulate Gene Expression	548
20-3	snRNPs and scRNPs	
	U-snRNPs React with Autoimmune Antibodies	549
	Microinjected U-snRNAs Migrate into the Nucleus	551
	The La Protein Binds to RNA Polymerase III Early Transcripts	553
	scRNPs; Alu 7S RNA Is Part of the Signal Recognition Particle Required for Protein Secretion	553
	Summary: Eukaryotic mRNA, snRNA, and scRNA	554
	References	55
	Additional Readings	55

Chapter 21 RIBOSOMES, THE NUCLEOLUS, AND PROTEIN SYNTHESIS

21-1	Ribosomes	
	Ribosomes Have Two Subunits	559
	Ribosomal RNAs Are the Most Abundant Cellular RNAs	559
21-2	Ribosomal Proteins	
	Ribosomes Can be Dissociated and Self-Assembled	561
	Synthesis of Ribosomal Proteins is Controlled at the Translational Level	561
	Prokaryotic and Eukaryotic Ribosomes—Little Homology but the Same Basic Function	562

21-3	The Nucleolus and rRNA Biogenesis	563
	Nucleoli Are Rich in RNA	563
	Electron Microscopy of the Nucleolus shows a Fibrillar and a Granular Zone	564
	The Nucleolar Organizer Contains the Genes Coding for 18S, 5.8S, and 28S rRNA	564
	Ribosomal Genes are Tandemly Repeated and Separated by Spacer DNA	568
	The rDNA Spacer Acts as a Sink for Transcription Factors	568
	RNA Polymerase I Remains Bound to the Nucleolar Organizer During Mitosis	570
	Ribosomal DNA Is Highly Amplified in Oocytes	571
	Ribosomal RNAs Undergo Complex Processing in the Nucleolus	573
21-4	5S RNA Biosynthesis	575
	5S Genes—Tandem Repeats with Spacers, but Outside the Nucleolar Organizer	576
	Somatic- and Oocyte-Type 5S Genes	576
	5S Gene Transcription Requires Binding of a Protein Factor to the Middle of the Gene	576
	TFIIIA has DNA-Binding Fingers	577
	TFIIIA Also Binds to 5S RNA, Forming a 7S Storage Particle in Young Oocytes	578
	How are Oocyte-Type 5S Genes Switched Off in Somatic Cells?	579
	5S RNA Is Incorporated into Ribosomes in the Nucleolus	579
	Summary: Ribosome Biogenesis	580
21-5	Transfer RNA	581
	tRNAs Are Adaptor Molecules	581
	tRNAs Have a Common Cloverleaf Secondary Structure	581
	The Fidelity of Protein Synthesis Depends on the Correct Aminoacylation of tRNA	582
	tRNA Genes Have Two Internal Promoter Regions	583
	tRNA Processing—Long Precursors with Complex Posttranscriptional Modifications	583
21-6	Protein Synthesis	584
	Initiation of Synthesis Requires a Specific Initiator tRNA	585
	IF ₁ , IF ₂ , and IF ₃ —Protein Factors That Initiate Protein Synthesis	586
	Eukaryotic IF ₃ Is Phosphorylated by a Cyclic AMP-Dependent Protein Kinase	587
	Chain Elongation Requires Soluble Factors	588
	Chain Termination Requires Releasing Factors	589
	Polysomes Consist of Several Ribosomes Attached to the Same mRNA	589
	Antibiotics and Toxins Are Useful in Molecular Biology and Medicine	589
	Newly Made Proteins Are Targeted to Their Final Cellular Destination	591
	Summary: Transfer RNA and Protein Synthesis	591
	References	592
	Additional Readings	592
Chapter 22	GENE REGULATION	594
22-1	Gene Regulation in Prokaryotes	594
	The Lac Operon Is Induced 1000-fold by Lactose	595
	The Inducer Binds to the Repressor Protein	595

Repressors Bind Within Promoters and Prevent Attachment of RNA Polymerase	597
Lac Transcription Is Also Subject to Positive Control by the CAP-cAMP Complex	597
The <i>trp</i> Operon: Regulation of Transcription at Initiation and Termination	597
Enzymatic Activity Control Provides the Fine Tuning of Metabolism ..	599
22-2 Gene Organization in Eukaryotes	599
Highly Repetitive, Middle Repetitive, and Single-Copy DNA	600
Satellite DNAs Contain the Most Highly Repetitive Sequences	601
Moderately Repetitive DNA—rDNA, 5S DNA, Histone Genes, Telomere and Centromere DNA	602
Transposons Are the Main Component of Middle Repetitive DNA	602
Single-Copy Genes and Pseudogenes	605
Processed Genes Arise by Reverse Transcription of mRNA and Insertion in the Genome	605
22-3 Retroviruses and Cellular Oncogenes	605
Above Twenty Genes Can Produce Cancer in Man, Acting on the Same Pathway of Cell Proliferation	605
Human Cancers Have Mutated Oncogenes	607
Human Cancer Arises by Multiple Mechanisms, Including Chromosome Translocations	608
Summary: Gene Organization and Regulation	609
22-4 Polytene Chromosomes	610
Polytene Chromosomes Have a Thousand DNA Molecules Aligned Side by Side	610
Puffs Are Sites of Intense Gene Transcription	612
Puffs Can Be Induced by Ecdysone and by Heat Shock	613
Microinjection of a Transposon Permits the Transfer of Genes into Different Sites in the <i>Drosophila</i> Chromosome	614
22-5 Lampbrush Chromosomes	614
Lampbrush Chromosomes Are Found in Oocytes at the Diplotene Stage of Meiosis	614
Lampbrush Chromosomes—the Unineme Theory and C-Value Paradox ..	615
The Long Lampbrush Transcripts May be Due to Failure of Termination	616
Summary: Polytene and Lampbrush Chromosomes	619
References	619
Additional Readings	619
Chapter 23 CELL DIFFERENTIATION	621
23-1 General Characteristics of Cell Differentiation	623
The Differentiated State Is Stable	623
Determination Can Precede Morphological Differentiation	623
Cell Differentiation Results from Stepwise Decisions that are Genetically Controlled	624
Summary: Cell Differentiation	628

23-2	Localisation of Cytoplasmic Determinants in Eggs	629
	Experimental Embryology 100 Years Ago	629
	The Genome Remains Constant During Early Development—Nuclear Transplantation	631
	Cytoplasmic Localisations May Determine the Initial Differences between Embryonic Cells	633
	Germ Cell Determinants	633
	Egg Stockpile Materials for Use During Early Development	636
	The Mid-Blastula Transition	636
	Cell Interactions Become Increasingly Important as Development Advances	637
	Summary: Cytoplasmic Determinants	638
23-3	Nucleoplasmic Interactions	640
	Red Blood Cell Nuclei Can Be Reactivated by Cell Fusion	640
	Cell Fusion Yields Pure Antibodies of Medical Importance	642
	Gene Expression by Somatic Nuclei is Reprogrammed in <i>Xenopus</i> Oocytes	644
	Summary: Nucleocytoplasmic Interactions	644
23-4	Molecular Mechanisms of Cell Differentiation	646
	Control at the Level of Transcription	646
	Translational Control	647
	Gene Amplification—A Rare Event	648
	Drug Resistance Can Induce Gene Amplification	649
	Transposable Genes in Yeast and Trypanosomes	650
	Gene Rearrangements during Lymphocyte Differentiation—Molecular Immunology	651
	Control of Immunoglobulin Secretion by Differential RNA Processing	653
	The Heavy-Chain Class Switch Involves Additional DNA Deletions	653
	Cell Differentiation in Adult Tissues	655
	Summary: Molecular Differentiation	656
	References	658
	Additional Reading	658
Chapter 24	CELLULAR AND MOLECULAR NEUROBIOLOGY	660
24-1	General Organization of Nerve Fibers—Axon Transport	661
	Axon Ultrastructure—Neurotubules and Neurofilaments	662
	Macromolecules are Transported through the Axon	666
	Anterograde Axonal Flow May be Fast or Slow	666
	Macromolecules Such as NGF Undergo Retrograde Axonal Transport	668
	Tetanus Toxin and Some Neurotropic Viruses May Undergo Retrograde and Transsynaptic Transport	670
24-2	Functions of the Nerve Fiber	670
	Nerve Conduction Velocity—Related to Diameter, Myelin, and Internode Distance	670
	The Action Potential—Nondecremental and Propagated as a Depolarization Wave	671
	Propagated Action Potentials Depend on Na ⁺ and K ⁺ Channels in the Axon Membrane	672

At the Physiological Receptors and Synapses Potentials Are Graded and Nonpropagated	674
Summary: General Organization of the Neuron and Function of the Nerve Fiber	674
24-3 Synaptic Transmission and Structure of the Synapse	674
Nerve Impulse Transmission Is Mediated Mainly by a Chemical Mechanism	676
Synaptic Transmission May be Excitatory or Inhibitory	677
Several Thousand Synapses May Impinge on a Single Neuron	678
The Number of Synapses Is Related to That of the Dendritic Spines	679
The Synapse Ultrastructure Suggests Many Types of Functional Contacts	679
Lectin Receptors and Postsynaptic Densities May Play a Role in the Formation and Maintenance of Synapses	682
The Presynaptic Membrane Shows Special Projections at Active Zones	682
The Postsynaptic Membrane Shows a Complex Macromolecular Organization	684
Summary: Structure of the Synapse	684
24-4 Synaptic Vesicles and Quantal Release of Neurotransmitter	685
Several Types of Synaptic Vesicles May be Recognized by Morphology and Cytochemistry	685
Neuronal Development—The Type of Neurotransmitter and Synaptic Vesicle May be Medium-Determined	686
Synaptosomes, Synaptosomal Membranes and Synaptic Vesicles May be Isolated by Cell Fractionation	688
Neurotransmitters—Synthesis and Metabolism of Acetylcholine	689
Neuropeptides and the Opioid System	689
Cytochemical Identification of Neuronal Systems—Coexistence of Neurotransmitters	691
The Transport of the Neurotransmitter Involves the Synaptic Vesicles	693
Transmitter Release Is Related to the Role of Synaptic Vesicles in Nerve Transmission	694
Transmitter Release Probably Involves Exocytosis with Recycling of Synaptic Vesicles	695
The Depolarization-Transmitter Secretion Coupling Is Mediated by Calcium Ions	696
Summary: Synaptic Vesicles and Transmitter Release	697
24-5 Synaptic Receptors and the Physiological Response	698
The Acetylcholine Receptor Is Coupled to the Translocation of Sodium and Potassium Ions	698
The Change in Membrane Potential Depends on the Ions Translocated	699
Synaptic Receptors Are Hydrophobic Proteins Embedded in the Lipoprotein Framework of the Membrane	701
Reconstitution of the AChR in Model Membranes	702
Neurotransmitter Synthesis and Release—Modulated by Presynaptic Receptors	704
Long-lasting Synaptic Functions Involve the Use of a Second Messenger	705
A Third Step in Neuronal Regulation—Protein Phosphorylation and Synapsin I	706

Learning, Memory, and the Functional Effectiveness of Synapses	708
Summary: Receptors and the Physiological Response	708
References	709
Additional Readings	710
GLOSSARY	713
INDEX	721
