Foreword	...	
Introduction	...	
Preface	...	
Chapter No.		Page No.
1.	Genetics, Phenotypes, Genotypes ...	1-7
	✓ Physical basis of heredity ; chromosomes, permanent structure of a cell ; discovery of genes by Mendel ; Phenotypes. Genotypes; Nucleohistone ; nucleoplast. DNA and synthesis of DNA. Origin of variations by mutation ; Incomplete dominance ; Symbolic representation of genotypes.	
★ 2.	Cell Division and Life Cycles ...	8-24
	✓ Mitosis ; chromosomes ; gap period ; main events of interphase ; significance of mitosis. Meiosis ; gametogenesis ; 1st meiotic division, 2nd meiotic division ; haploid number ; chiasmata, crossing over ; <u>significance of meiosis</u> . Life cycle of <i>bacteriophage</i> , <i>Neurospora</i> (tetrad analysis) <i>Chlamydomonas</i> & <i>Drosophila</i> .	
3.	Structure and Duplication of Genetic Material ...	23-34
	Macromolecules, micromolecules ; 1st discovery of nucleic acids ; significance of discovery of bacteriophage ; experiments of Alfred Hershey and Martha Chase ; Feulgen stain, Photometer ; Griffith's experiments on transformation ; structure of DNA, replication of DNA and experimental proof.	
★ A 4.	Segregation of Genes (MONOHYBRID CROSS) ...	35-55
	✓ The beginning of Genetics ; Segregation of traits in diploid organisms, Law of Dominance, Law of segregation ; Human Pedigree, Pedigree analysis ; <u>Incomplete Dominance</u> , Segregation of traits in haploid organisms, <i>Chlamydomonas</i> , <i>Neurospora</i> . Solved problems of the text.	

★ 5. Law of Independent Assortment (DIHYBRID CROSS) ... 56—58

Law of Independent Assortment in Diploid and Haploid organisms, Test Cross, Probability, mutually exclusive and independent events, level of significance, degrees of freedom, Chi-square test. Solved problems of the text.

6. Physical Basis of Heredity ... 86—90

7. Sex-linked Inheritance ... 91—102

Sex determination xo , xy and zw systems of sex determination; sex linked inheritance; special cases of sex determination; attached-X-chromosomes in *Drosophila*. Solved problems related to the chapter.

✓ 8. Polyploidy, Variation in Chromosome number ... 103—109

Autopolyploids, Allopolyploids, Aneuploidy, Polysomic, Nullisomic; Significance of polyploidy.

★ 9. Linkage and Recombination of genes ... 110—142

✓ Discovery of linkage, Coupling and Repulsion, ✓ Linkage groups. Crossing over; Maximum limits of crossing over and percentage of recombinants; Absence of crossing over in *Drosophila* males.

10. Cytoplasmic Inheritance ... 143—147

Larval skin and eye color in *Ephestia* (moth); coiling of shell in *Limnea*; CO_2 sensitivity in *Drosophila*; plastid's inheritance in *Mirabilis jalapa*; *toja p* gene; kappa particles in *Paramecium*.

11. Recombination of Heredity Material in Bacteria and viruses ... 148—158

Conjugation and recombination; sexual mating types in bacteria; experiments of Jacob and Monod by interrupting conjugation; relationship of recombination to the time period of conjugation. Transduction; prophage (temperate phage); lysis; host guest relationship; examples of transduction in *Salmonella* and *E. coli* (K & B); plaque. Transforming principle; experiments with M-mutants. Sulpha drug & Amethopterin resistant bacteria.

Possible mechanisms for genetic recombination; crossing over, copy choice (or Belling hypothesis).

12. Mutation

... 159—169

Examples of mutations; isoalleles; induction of mutation by radiations and mutagens; chromosomal aberrations, deletion, inversion, translocation and duplication. Molecular interpretation of mutation; tautomeric shift; 5-Bromo-uracil induced mutations; analogue induced mutations; transitional mutations; effect of nitrous acid, nitrogen mustard gas, and proflavin in induction of mutations. Sulpha-nilamide analogue. Hot spots

13. Gene Action and the Synthesis of Proteins ... 170—182

Genetic control of biosynthetic pathways. *Alkaptonuria*, *Phenylketonuria*, *Arginine* biosynthesis in *Neurospora*, *Tyrosinase* synthesis in *Neurospora*, *Tryptophan* synthesis in *E. coli* and *Neurospora*. Immunological properties of proteins, experiments with *tryptophan synthetase* as an antigen. CRM. Mutations and amino acid sequence of hemoglobin; types of hemoglobins; role of genetic material in protein synthesis.

14. Genetic Units of Recombination, Mutation and Function ... 183—195

Multiple alleles; locus; *Wild*, *Albino*, *Chinchilla* and *Himalayan* coat colors in rabbit; *A*, *B*, *AB*, and *O* blood group series; antigens and antibodies. Pseudo-alleles; lozenge eye alleles: cis-trans position effect. Complementary genes; *y*, *ad⁸* & *ad¹⁶* mutants in *Aspergillus* and cis-trans effect. Cistron, recon and muton. Zerosites. Genetic regulation; synthesis of Histidine in *Salmonella*; utilization of lactose by *E. coli*; *Permease* and *B-galactosidase* enzymes; structural genes; operon.
