

UNDERSTANDING GENETICS

NORMAN V. FOTHWELL

Contents

Preface	vii
---------------	-----

CHAPTER 1. Foundations of Genetics 1

Achievements before 1900	1	The Testercross and Its Value	14
Mendel and the Choice of a Genetic Tool	4	Dihybrid Testercrosses and Independent Assortment	14
Mendel's Monohybrid Crosses	5	• Independent Assortment and the F_2 Dihybrid Ratio	17
• Mendel's Law of Segregation	6	• Separate Chromosomes and Independent Assortment	17
Blending Inheritance Disproved	8	Recognition of the Significance of Mendelian Principles	21
Dominance Is Not Always Absolute ...	11		
Misconceptions To Be Avoided	12		
Interpretations of Crosses and Ratios ..	13		

CHAPTER 2. Chromosomes and the Distribution of the Genetic Material 23

All Cells Must Solve Certain Problems .	23	• Chromosome, Chromatid, and the Distribution of Genetic Information	30
Communication between Nucleus and Cytoplasm	25	Chromosomes in the Nondividing Nucleus	32
• The Distribution of the Genetic Material	26	• Changes at Mitosis	32
• Chromosome Morphology	26	Giant Chromosomes	35
• Homologous Chromosomes and Genetic Loci	30		

CHAPTER 3. Chromosomes and Gamete Formation 37

Meiosis Entails Two Nuclear Divisions .	37	• Each Chromosome Is Doubled	38
The Morphology of the Early Meiotic Chromosome	38	The Chromatids Separate	40
• The Homologous Chromosomes Pair ..	38	• Chromosome Behavior at Meiosis and Mendel's Laws	42

CONTENTS

Second Meiotic Division Effects True Reduction	44	Meiosis in the Higher Plant	52
Meiosis in the Male	47	Mitosis and Meiosis Are Common to All Eukaryotes	55
Meiosis in the Female	52		

CHAPTER 4. Genic Interactions 56

• Genotype, Phenotype, and Characteristic	56	Basis for Variation in Genic Expression	69
• Interaction of Two or More Pairs of Genes	56	Importance of the Environment in Gene Expression	71
• Appreciation of Genic Interaction and the Nature of Wild Type	58	The Importance of Both Environmental and Hereditary Factors	73
Genic Interaction and Modified Ratios	59	Genes Which Influence Survival of the Individual	76
The Basis of Genic Interaction	62	Lethals and the Environment	77
Interrelated Pathways in Metabolism	65	• The Naming of Genes and Loci	78
Variation in Gene Expression	67		

CHAPTER 5. Sex and Inheritance 81

• Sex Chromosomes	81	Sex Chromatin	106
• Genes on the X Chromosome; Sex Linkage	83	The X Chromosome and the Lyon Hypothesis	106
• Sex Linkage and the Chromosome Theory of Inheritance	85	Evidence for the Lyon Hypothesis	107
Sex and Genic Balance	89	The Sex Ratio	108
• The Y Chromosome in Humans	92	• Incomplete Sex Linkage	109
The Human Chromosome Complement	93	Holandric Genes	111
Sex Chromosome Anomalies in Humans	97	Sex Influenced Genes	111
Sex Mosaics	101	Sex Limited Genes	112
Sex Linkage in Humans	102	Further Aspects of the Hormonal Environment	113

CHAPTER 6. Probability and Its Application 116

Certainty vs. Probability	116	Constructing a Pedigree	121
Combining Probabilities	117	Examining a Pedigree	121
The Same Combination May Arise in Different Ways	118	Representative Pedigrees	123
Expansion of the Binomial and Its Application	119	• Chi-Square and Probability	123
More than Two Alternatives	120	• Chi-Square and Its Application	127
		Exercise on Pedigree Analysis	131

CHAPTER 7. Continuous Variation and Its Analysis

133

Continuous vs. Discontinuous Variation	133	Problems	142
The Effects of Inbreeding	134	The Mean and Its Calculation	144
Genetic vs. Environmental Variation	134	The Standard Deviation and Its Im- portance	145
Genes and Quantitative Inheritance	136	Variance as a Measure of Variability	147
Quantitative Inheritance and Skin Pig- mentation	136	The Standard Error of the Mean and Its Importance	148
Quantitative Inheritance and Deep Seated Characteristics	139	The <i>t</i> Test and the Difference Between Means	150
Estimation of Gene Differences and Their Quantitative Contribution	140	Statistics and the Inheritance of Intel- ligence	150
Transgressive Variation	142		
The Importance of Statistics to Genetic			

CHAPTER 8. Genes on the Same Chromosome

154

Independent Assortment vs. Complete Linkage	154	Significance and Use of a Chromosome Map	175
Crossing Over and Its Calculation	160	Mapping Three Genes on the X Chrom- osome	177
Linkage and the F_2 Generation	161	Map Length and the Amount of Re- combination	179
Genes Linked on the X Chromosome	163	Linkage and a Linear Order of Genes	181
Linkage Groups and Chromosomes	168		
Chromosome Mapping	169		
Trihybrid Crosses and Mapping	172		

CHAPTER 9. Further Aspects of Linkage and Crossing Over

183

Assignment of Loci in Humans	183	<i>Neurospora</i> as a Tool in Crossover Analysis	190
Linkage in Humans and Its Application	183	Somatic Crossing Over	192
Factors Influencing Crossover Fre- quency	186	Importance of Crossing Over to Evolu- tion	193
Cytological Proof of Crossing Over	188		

CHAPTER 10. Changes in Chromosome Structure and Number

198

Point Mutations vs. Chromosome Anomalies	198	Importance of Translocations in the Evening Primrose	206
The Inversion and Its Consequences	198	Significance of Translocations in Hu- mans	208
Inversions in <i>Drosophila</i>	200	The Detection of Deletions	212
Different Types of Inversions	202	Deletions and Mapping	212
The Translocation	203		

Effects of Deletions in Various Species	215	Aneuploidy in Humans	224
Duplications: Their Origin and Effects	216	Aneuploidy in Plant Species	226
Duplication of the Bar Locus and Position Effect	218	Autopolyploidy: Its Origin and Effects	228
Heterochromatin and Position Effect	220	Allopolyploidy and Speciation	230
Chromosome Alteration and Evolution	221	Polyploidy in Animals	234
Variation in Chromosome Number	224	Chromosome Anomalies and the Human	235

CHAPTER 11. **Chemistry of the Gene** 238

The <i>Pneumococcus</i> Transformation	238	Watson-Crick Model	246
Additional Evidence for DNA as the Genetic Material	240	Implications of the Watson-Crick Model	249
Chemistry of Nucleic Acids	244	Experimental Testing of the Watson-Crick Model	252
Physical Structure of DNA and the			

CHAPTER 12. **Allelism, Antigens, and Antibodies** 259

Detection of Mutations at Different Loci	259	Multiple Alleles and the ABO Blood Grouping	268
Detection of Separate Mutations at One Locus	260	The MN Blood Grouping	271
Crossing Over within a Gene	262	Antigens and the Rh Blood Grouping	271
Multiple Allelic Series in Animals and Plants	265	Further Significance of Blood Groupings	276
		Antigens, Grafting, and Transplants	277

CHAPTER 13. **Gene Mutation** 280

Somatic and Germinal Point Mutations	280	Interaction of Radiation and Other Factors in the Production of Mutations	290
Typical Consequences of Spontaneous Mutation	282	Ultraviolet and the Induction of Mutations	290
Mutation Rate and Some Factors Which Influence It	283	Chemical Mutagens	293
High Energy Radiations and Their General Effects on Matter	284	Repair of Damaged DNA	293
Radiations and Mutation Rate	286	The Effect of Chemical Mutagens on the Molecular Level	295
Suggested Mechanisms of Radiation Action on the Genetic Material	289		

CHAPTER 14. **Genes, Populations, and Evolutionary Change** 301

Populations as Units of Evolutionary Change	301	Equilibrium Frequency of Genes in Populations	302
---	-----	---	-----

Application of the Hardy-Weinberg Law to Gene Frequencies in Populations	304
Lethal and Detrimental Genes in Populations	307
Genetic Load and the Mutant Gene Pool	308

Interference with Natural Selection	310
The Sickle Cell Gene in Populations	311
Hybrid Vigor and Its Basis	313
Gene Equilibrium and Evolution	315
Interaction of Mutation, Natural Selection, and Drift	315
Role of Genetic Isolation in Speciation	318

CHAPTER 15.

Information Transfer

320

Gene Control of Protein Synthesis	320
Transfer RNA and Some of Its Interactions	325
Transcription and Messenger RNA	326
Evidence for a Triplet Code	330

Codons and Their Assignments	334
Features of the Genetic Code	337
The Ribosome and Some of Its Interactions	340
Molecular Interactions in Translation ..	342

CHAPTER 16.

Molecular Interactions

347

Processing of Ribosomes	347
Choice of DNA Strand in Transcription	349
Initiation of Translation	350
One Gene-One Polypeptide Chain	353
Allelism and the Functional Unit on the Molecular Level	354

Colinearity	356
Fingerprinting and Mutant Hemoglobins	357
Molecular Basis of Certain Genetic Diseases	361
Synthetic DNA	362

CHAPTER 17.

Microorganisms: Bacteria as Genetic Tools

365

Variations in Microorganisms	365
Spontaneous Mutation in Microorganisms and the Fluctuation Test	365
The Replica Plating Technique	367
Detection of Sexual Recombination in Bacteria	367
The Fertility Factor	371
Partial Genetic Transfer	373
High Frequency Types and the Transfer	

of Genetic Markers	374
Relationship among the <i>E. Coli</i> Mating Types	376
The F Factor as an Episome	379
Events in Chromosome Transfer from Hfr to F ⁻	381
Transformation in Relationship to Recombination	382
Transformation in Higher Life Forms	384

CHAPTER 18.

Viruses as Genetic Tools

388

Events following Infection by a Virulent Phage	388
Temperate Viruses and Prophage	389
Phages and Transduction	390

Recombination and the Genetic System of Phages	394
Repeated Mating in Phages	396
Phage Systems and the Recognition of	

The Cistron	397
Phage with Single Stranded DNA	401
Use of Viruses in the Isolation of a Gene	403
Tobacco Mosaic Virus—an RNA Virus	403
RNA Viruses and the Direction of Flow	

of Genetic Information	406
Implications of the Flow of Information from RNA to DNA	407
The Exact Nucleotide Sequence of a Viral Gene	409

CHAPTER 19.

Control Mechanisms and Differentiation

413

Cell Specialization and the Genetic Information	413
Genetic Control of Enzyme Induction in Bacteria	413
Repressors and the Repression of Enzyme Synthesis	417
Histones and Genetic Control in Eukaryotes	418
The Nonhistone Proteins and Regula-	

tion	420
Giant Chromosomes and Gene Activity	423
The Cytoplasm and External Environment in Cellular Differentiation	425
Implications of Genetic Control in Pathological Cell Changes	428
Differentiation in Relationship to Time and Aging	429

CHAPTER 20.

Nonchromosomal Genetic Information

432

Life Cycle of Paramecium	432
The Genetics of the Killer Trait	434
The Nature of Kappa and Related Particles	436
Inheritance of Preformed Structure	441
Extranuclear Genetic Information in Higher Species	443
Features of Mitochondria	443
The Petite Mutations in Yeast	444
Inheritance of Drug Resistance in Yeast	447

The Poky Trait in <i>Neurospora</i>	447
Features of the Chloroplast	448
Plastid Autonomy in Higher Plants	450
Nonchromosomal Genes in Chlamydomonas	454
Biological Implications of Genetic Information in Organelles	458
The Replicon	459
Resistance Transfer Factors	461

CHAPTER 21.

Some Problems for the Present and Future

465

Problems for the Genetic Counsellor and Genetic Engineer	465
Cell Fusion and Some of Its Applications	466
Delay of Aging and Cloning	470
Human Tampering with the Environ-	
Index	

ment and Its Genetic Implications	470
Drugs and the Genetic Material	472
Genetic Factors and Behavior	473
Behavior as a Complex Phenotypic Characteristic	475
Species Specific Behavior	476

481
